Abstract 7

This paper analyses data on poverty for 1971-2013 periods and finds that, Bangladesh reduces 8

- national poverty by 55.82 percent during these periods. Moreover, nearly 44 percent people 9
- are found extremely poor who earn less than 10
- 1.25 perday and 77 percent people are moderately poor who earn less than 2 per day. Though, 11
- absolute income poverty declines but income inequality rises by 30 percent in these periods. 12
- However, different international indexes disclose that, Bangladesh also reduces human poverty. 13
- Bangladesh is no longer the member of ?alarmingly hunger countries? and will become the 14
- member of ?Medium human development countries? by 2014. Besides, about 58 percent 15
- people are found multi-dimensionally poor, who suffer from overlapping deprivations in health, 16
- education and standard of living. Finally, this paper makes a comparison between Bangladesh 17
- and other south Asian countries and finds that, Bangladesh has the highest level of poverty 18
- followed by India in this region 19
- 20

Index terms — poverty, income inequality, human development, population, bangladesh, south asia. 21

1 Introduction 22

23 angladesh, is one of the most poorest and 5 th densely populated country in the world with 1.37 percent population 24 growth per year (United Nation, 2012, pp.; 41-51 and GOB, 2013, pp.; 183-189). More than 154 million people 25 lives in this country with 47 million poor people. The current GDP of this country is \$116.4 billion with per capita GDP\$ 859. Moreover, it is a low income country with yearly 6.03 percent GDP growth and most of its 26 27 income is generated from the industrial sectors followed by agricultural sector ??GOB, 2013, pp.279-351).

28 The life expectancy of its people at birth is 65 years only; maternal mortality ratio (MMR) is 194 per 100000 live births While 65 deaths per 1,000 live births occur among children under 5 years of age (UNICEF, 2012, 29 pp.1-12, BMMS, 2010, pp.2-24, WHO, 2013, pp.67). 30

In addition, the adult literacy rate is only 57.91 percent and labor force (15-64 years) comprises by 62.1 percent 31 of total population (BBS, 2010, pp. 23). Bangladesh has achieved significant success in reducing extreme poverty 32 during the last 42 years ??BBS, 2011, pp.132-141). 33

Now, a close look on definition and measurement of poverty is necessary for further Author: Lecturer in 34 35 Economics, Department of Business Administration, International Islamic University Chittagong, Chittagong, 36 Bangladesh. e-mail: m_basarat06@yahoo.com discussion. World Bank points out the definition of poverty from 37 a representative sample of 60,000 poor people from 60 developing countries during the 1990s. The poor see that,

- Poverty is multidimensional. Poverty consists of many interlocked dimensions. The extreme is hunger -the lack 38
- of food, some psychological dimensions are powerlessness, voicelessness, dependency, shame, and humiliation. 39
- Moreover, poor people lack access to basic infrastructure -roads (particularly in rural areas), transportation, and 40
- clean water. No education or poor schooling. Poor health and illness as a source of destitution, low income and 41
- gender discrimination (World Bank, 1996 and Narayan et al 2000, pp.9-27). Nafziger (2006) in his book mentions 42
- that, Poor people live without fundamental freedoms of action and choice that the better off take for granted. 43

They ??suffer] deprivations that keep them from leading the kind of life that everyone values. They also face extreme vulnerability to ill health, economic dislocation, and natural disasters. And they are often exposed to ill treatment by . . . the state and society ??Nafziger, 2006, pp. 165-189,).

More precisely, Sen (1983 ??en (, pp. 153-169, 1985, pp.2-9) defined the poverty as the lack of «capability» to function in a given society. That means, the individual has a space of «functioning», where a person is either actually able to do (realized functioning) or the set of alternatives he/she has (real functioning). This space may be very basic (food, shelter) or complex (freedom, self-respect, social inclusion, etc.).

United Nation defines Poverty as a mirror that reflects the miseries of deprived people who have 51 struggle with hunger to survive. The United Nations Development ??rogram (2000) defines 52 topoverty into two general classifications: income poverty and human poverty (UNDP, 2000, pp. 53 [5][6][7][8][9][10][11][12][13][14][15][16][17][18][19][20][21][22]. Income poverty is an understanding of poverty 54 that is solely based on levels of monetary income. According to the World Bank, people, who earn less than 55 US\$1.25 per day, are living in extreme poverty, and people who earn less than US\$2 a day are in moderate 56 poverty (World ??ank, 2008, pp.28). 57

Furthermore, Poverty can be either relative or absolute. Absolute poverty measures the number of people living below a certain income threshold or the number of households unable to afford certain basic needs such as food, clothing, and shelter. Conversely,

Abstract-This paper analyses data on poverty for 1971-2013 periods and finds that, Bangladesh reduces national poverty by 55.82 percent during these periods. Moreover, nearly 44 percent people are found extremely poor who earn less than \$1.25 per day and 77 percent people are moderately poor who earn less than \$2 per day. Though, absolute income poverty declines but income inequality rises by 30 percent in these periods. However, different international indexes disclose that, Bangladesh also reduces human poverty. Bangladesh is no longer the member of 'alarmingly hunger countries' and will become the member of 'Medium human development countries' by 2014. Besides, about 58 percent people are found multi-dimensionally poor, who suffer from overlapping deprivations in health, education and standard of living. Finally, this paper makes a comparison between Bangladesh and other south Asian countries and finds that, Bangladesh has the highest level of poverty followed by India in this region. Relative poverty defines poverty in relation to the economic status of other members of the society: it measures

the distribution of income and wealth across the population ??Sen, 1992, pp.47-52). It reflects the inequality 73 in the bottom-half of the income distribution and the cost of social inclusion and equality of opportunity in a 74 specific time and space (Smelser & Baltes, (2001) In Bangladesh, Bangladesh Bureau of Statistics (BBS) uses 75 76 the Cost of Basic Needs (CBN) method to measure Income poverty and Direct Calorie intake ((DCI) method to 77 measure both the extreme poverty (absolute as well as Hard-core poverty) (BBS, 2010). CBN method is used to 78 design food and non-food poverty line. The food poverty line is determined according to three steps: (1) a basic food basket is identified from the data, consistent with consumption patterns, (2) The quantities in the basket 79 80 are scaled accordingly to correspond to the nutritional requirement and (3) The cost of acquiring the basket is calculated. A non-food poverty line is calculated by estimating the cost of consuming a basic set of non-food 81 goods for (i) extreme poor households whose total expenditures equals the food poverty line (ii) moderate poor 82 households whose food expenditure is at food poverty line (BBS, 2010). 83

Direct Calorie Intake (DCI) is used to determine the absolute and Hard-core poverty. Household is absolute poor if its per capita calorie intake is less than the standard per capita nutritional requirement 2122 kilo calories per day and Household is hard-core poor if its per capita calorie intake is less than 1805 kilo calories(BBS, 2010, pp.48-62).

To measure the human poverty, different international indexes including Human Development Index (HDI), 88 The Global Hunger Index (GHI) and Multidimensional Poverty Index (MPI) are used in this paper. Human 89 Development Index (HDI), first introduced in 1990 by the UNDP, is a composite measure of indicators along 90 three dimensions: life expectancy, educational attainment and income needed for a decent living. It ranges 91 between 0 (lowest level of human development) and 1 (highest level of human development). According to the 92 Human Development Report 2013, those countries with an HDI score of over 0.800 are part of the very High 93 Human Development group. Those between 0.711 and 0.800, 0.535 and 0.710 are included in the group of high 94 and Medium Human Development countries. And, those that fall below 0.534 are the Low Human Development 95 countries (UNDP, 2013, pp.64). 96

97 Since Hunger is a dimension of extreme poverty (Pinstrup & Fuzhi, 2007, pp.96-103). Hunger index is used 98 to measure the human poverty. The Global Hunger Index (GHI) was first introduced and published in 2006 99 by the International Food Policy Research Institute (IFPRI), Welthungerhilfe and Concern Worldwide' to 100 comprehensively measure and track hunger globally and by country and region. The GHI combines three equally weighted indicators: 1) the proportion of the undernourished as a percentage of the population; 2) the proportion 101 of underweight children under the age of five; and 3) the mortality rate of children under the age of five. GHI 102 counts the scores, and rank countries on a 100-point scale in which zero is the best score (no hunger) and 100 the 103 worst. The high score mean the worst hunger situation in a country. Values less than 4.9 reflect "low hunger", 104 values between 5 and 9.9 reflect "moderate hunger", values between 10 and 19.9 indicate a "serious", values 105

between 20 and 29.9 are "alarming", and values exceeding 30 are "extremely alarming" hunger problem (IFPRI, 106 2013.pp.5-56). 107

Multidimensional Poverty Index (MPI) was first introduced by the Oxford Poverty and Human Development 108 Initiative (OPHI) and UNDP in 2010. The index uses the three dimensions: overlapping deprivations in health, 109 education and living standardsrather than income. These are measured using ten indicators. Child Mortality, 110 Nutrition under health category, Years of school, Children enrolled under education, and Cooking fuel, Toilet, 111 Water, Electricity, Floor, Assets under standard of living category. Each dimension and each indicator within a 112 dimension is equally weighted. If people are deprived in a three or more of ten (weighted) indicators, the global 113 index identifies them as 'MPI poor' (suffering deprivations in 33.33 percent of weighted indicators). The global 114 MPI has been published in the HDR2013 ever since, and assesses multidimensional poverty in 104 countries for 115 which data are available (MPI-UNDP, 2013, pp.29). 116

3 II. 117

Objective $\mathbf{4}$ 118

The main objective of this paper is to reveal the success of Bangladesh in poverty reduction during 1971-2013 119 periods and its recent trends in Bangladesh. More specifically, the aim of this research paper is to disclose that, 120 whether the different types of poverty increases or decreases in Bangladesh during 1971-2013 periods and what 121 is the recent scenario. 122

5 Methodology 123

This paper is a descriptive analysis of poverty incidence in Bangladesh. This paper employed different method 124 of World Bank, United Nation, and Government of Bangladesh to measure the poverty incidence in Bangladesh. 125 The details description of these methods is given in section (I) the all data of this study are collected from the 126

secondary sources. The data on national income poverty, rural and urban poverty, absolute and hard core poverty, 127 relative poverty, education and land poverty are collected from Bangladesh Household income and expenditure 128

survey (HIES) ??005 129

6 Literature Review 130

The United Nation study finds that on average income growth is the major driving force behind both the declines 131 and increases in poverty. The rise of income inequality is the causes of severe poverty in Bangladesh (UNU-132 WIDER, 2010, pp.22-37). However, Bangladesh experiences a declining trend in poverty compared to 1970s. 133 But inequality rises and a large proportion of people still struggling for survival because, poverty is not a high 134 priority for the Bangladeshi elite politicians, businessmen, bureaucrats ??Naomi, 2005, pp.8-40). Sen (2008) 135 finds that, to increase 'capability of women under the human development', Bangladesh has gone ahead of India. 136 Moreover, Bangladesh set it target to halve the extreme poverty (live on less than 1.25\$ per day) to 24.9 percent 137 by 2015(World Bank, 2013, pp.112). 138

Among the recent works, Hossain (2009, pp.5,) analyzes the dynamics of rural poverty in Bangladesh. ??cLeod 139 (2007, pp.38-52) shows the poverty trends in Bangladesh for 1990-2005 periods. Urban poverty persists in 140 Bangladesh due to huge Slum population, unplanned Migration and Social dis-Integration ??Shahadat, 2010, pp. 141 18-32). The paper of ?? li and Begum (2006, pp.3) exposes the performance of recent poverty and Social Indicators 142 for 1990-2005 periods. Murgai and Zaidi (2005, pp.7-32) reveal the research outcome on the poverty of 1990s of 143 Bangladesh in their article. ??slam (2004, pp.29-49) presents the poverty change sscenario by investigating 1983-144 2000 period data. However, this research paper is different from the earlier research in a sense that, it analyzes 145 42 years data for 1971-2013 periods, which is longer duration than previous. In addition, this paper investigates 146 both income and human poverty trends in Bangladesh. This paper also discloses the income inequality scenario 147 between rich and poor people. Another addition of this work is the making of comparison in poverty incidence 148 of Bangladesh with other countries in south Asian region by using the latest national and international poverty 149 indexes. 150 V.

151

Poverty Reduction in Bangladesh: 7 152

153 Latest Scenario (Akash, 2003).

154 However, in 1980s, the poverty incidence fluctuates in different years and declines, but was also at high level. 155 Figure-1(a) reveals that, according to the lower poverty line, the average national poverty rate decreases to 39 156 percent in 1980s compared to 47 percent in 1970s. The annual rate of declining poverty in this decade was only 0.44 percent. In the same period; both rural and urban poverty declines and reaches to 44.30 percent and 22 157 percent in 1989 respectively. 158

Actually, the rate of poverty reduction became faster after the year of 1990 and the annual rate of decreasing 159 poverty was the highest 4.86 percent in 2000s compared to 1.64 percent in 1990s. In 2010, the national poverty 160 rate was only 17.6 percent which is about 64 percent lower than the 1973's poverty. 161

The similar declining trend is recorded under the upper poverty line (see Figure -1(a)). During 1973-2010 162 periods, the incidence of poverty decreases by 56 percent, and reaches to 31.5 percent in 2010 compared to 163 71.3 percent in 1973. The highest level of poverty declines in 2000s compared to other decades and the annual 164 declining rate is 3.5 percent in 2000s which was 1.2 percent in 1980s and 1.8 percent in 1990s correspondingly. 165 Moreover, the data exposes that, the overall rural as well as urban poverty rate was also declining during the 166 last four decades but rural poverty was always higher than the urban poverty. Figure-3(a) describes that, income 167 inequality in Bangladesh increases overtime. The values of Gini index presents that, the income gap between rich 168 and poor people increases to nearly 50 percent during 1973-2010 periods. The alarming evidence is that, though 169 the absolute income poverty decreases overtime, but relative income poverty increases significantly at the same 170 period. The Gini coefficient in Bangladesh rises to 0.47 in 2010 compared to 0.36 in 1973 at national level while 171 this figure recorded as 0.43 and 0.45 in rural and urban areas. The income discrimination is much worst in urban 172 areas then the rural areas. 173

Additionally, the strong proofs of income inequality are found from the analysis of income sharing scenario 174 in figure-3(b). In 2010, top 5 percent highincome group household occupies 25percent of total income against 175 the 0.77 percent of the bottom 5 percent low-income group household. This indicates that, the richest 5 percent 176 people hold about 25 time higher income from the poorest 5 percent people in Bangladesh. In addition, this 177 178 situation is much worse between the richest as well as the poorest 10 percent of people. The richest 10 percent 179 has about 36 time higher income than the poorest 10 percent. The implication is that, the income discrimination 180 in Bangladesh is on the upward trends since its independence and riches become richer and poor become poorer 181 day by day.

b) The Trends in Human Poverty i. International Poverty index: Bangladesh Scenario Hunger is the sign of 182 extreme poverty. Global Hunger index (GHI) counts the scores, and rank countries on a 100-point scale where 183 zero is the best score (no hunger) and 100 the worst. The lower the scores mean the lower hunger level. Figure 184 -4(a) shows that, during 1990-2013 periods, Bangladesh successfully reduces the hunger level among poor by 47 185 percent. Besides, its GHI score declines to 19.4 in 2013from 36.7 in 1990.But still now, it stays in the zone of 186 'serious hunger (score: 10-19.9)' (IFPRI, 2013, pp.5-56). Though its HDI score exceeds the 0.500 level in 2008, it 187 takes four years to reach 0.515 in 2012. Bangladesh with a Rank 146 is still included in the group of 'low human 188 development' countries (below 0.534 HDI score) in 2013. Moreover, human development report also reveals 189 that, the living standards dimension contributes more than the health and education dimensions. Besides, it is 190 recorded that, Gross national income (GNI) per capita adjusted to 2005 purchasing power parity (PPP \$) is 1781 191 and life expectancy at birth is 69.2 years, where child survival rate is higher among educated people compared 192 to uneducated or lower educated people. In addition, during the same period, dependency ratio decreases by 193 40.80 per cent. Furthermore, average mean years of schooling are only 4.8 years, which is very performance in 194 education index and alarming for human development (UNDP, 2013). 195

ii. Incidence of Poverty (CBN) by Educational Statistics and Ownership of Land Poverty is high among the 196 illiterates than the literates' people (see table-1). The household income and expenditure survey (HIES, 2010) 197 report discloses that, 42.8 percent poor are illiterates compared to 19 percent of the literates poor in 2010. 198 Moreover, the proportion of declining poverty among literates poor (34.48 percent) is higher than that among 199 illiterates' HDI score poor (33.33 percent). However, the poverty is much severe in terms of Land ownership. 200 About 47 percent poor were landless in 2000. Between 2000 and 2010; the number of landless poor declines by 201 24 percent and reached to 35.4 percent in 2010. Since there is an inverse relationship between land ownership and 202 incidence of poverty, redistribution of land is indispensable to reduce land poverty in Bangladesh (BBS, 2010). 203 204

iii. Millennium Development Goals and achievements of Bangladesh

The United Nation's Millennium Development Goals conflate hunger and poverty in its first goal to "eradicate 205 extreme poverty and hunger." The indicators used for this goal measure income poverty, undernourishment, and 206 malnutrition (MDGR-UNDP, 2013,pp. . Bangladesh has made commendable progress in respect of eradication 207 of extreme poverty and hunger. The latest HIES (2010) data show that the incidence of poverty declines at an 208 annual rate of 2.47 percent in Bangladesh during 1992-2010 periods against the MDG target of 2.12 percent. 209 Bangladesh has already met one of the indicators of target 1 by bringing down the poverty gap ratio to 6.5 in 2010 210 against the target of 8.0 in 2015. The estimated figures suggest that the MDG target of halving the population 211 living below the poverty line (from 56.7 percent to 29.0 percent) has already been achieved in 2012 (GOB, 2012, 212 pp.7-22). Figure-5 portrays that, in south Asian region, the overall poverty condition is worst in Bangladesh 213 than any other countries. Moreover, the highest number of extreme as well as moderate poor lives in Bangladesh 214 followed by India, Nepal and Pakistan respectively. On the contrary, Sri Lanka attained the great success in 215 reducing extreme poverty and has only 8.9 percent-the lowest level extreme poverty in this region. Besides, the 216 extreme poverty is also lowest as 7 percent at \$1.25 poverty line and 29.1 percent at \$2 poverty line in Sri Lanka 217 correspondingly. b) Human Poverty in South Asian Region) depicts that, in south Asian region, the hunger 218 is lowest in Sri Lanka (15.6 percent) followed by Nepal (17.3 percent), Pakistan (19.3 percent) and Bangladesh 219 ??19.3 percent).Bangladesh occupies the fourth position in reducing the hunger in this region while India stays 220 in the zone of 'alarming hunger' with 21.3 percent hunger score. In contrast, the multidimensional poverty is 221 highest in Bangladesh. Multidimensional Poverty Index (MPI) defines that, people are multidimensionally poor, 222 if they suffer from overlapping deprivations in health, education and standard of living. The highest multi-223 dimensional poor is living in Bangladesh (58 percent) followed India (54 percent), Pakistan (49 percent) and 224

Nepal (44 percent). Maldives is the country of the lowest multi-dimensional poor (5.2 percent) followed by Sri
Lanka (5.3 percent) in this region. Moreover, the intensity of deprivation is the highest in Pakistan (53 percent)
followed by Bangladesh (50 percent) and Nepal (49 percent) (MPI-UNDP, 2013).

²²⁸ 8 VI. Poverty in South Asian

²²⁹ 9 VII. Summary of Discussion and Key Findings

The national Poverty in Bangladesh decreases during 1971-2013 periods. The national poverty rate is recorded 230 31.5 percent in 2010 which was 71.3 percent in 1973. But in 2012, nearly 44 percent of total population are found 231 extremely poor who earn less than \$1.25 per day and about 77 percent people are moderately poor who earn 232 less than \$2 per day. This study also finds that, about 15 percent people are hardcore poor with less than 1805 233 kilo calories food intake per day and nearly 35 percent poor people have 2122 kilo calories food intake per day. 234 Though the absolute income poverty declines overtime but the relative income poverty increases at the same 235 time. The income inequality rises by 30 percent between 1973 and 2012. The income gap between the rich and 236 237 poor people also rises at the same period.

However, different international indexes disclose that, Bangladesh achieved the great success and changed its position in reducing human poverty. Global hunger index reports that, hunger decreases faster in Bangladesh in 2013 compared to the last two decades. Bangladesh is no longer the member of 'alarming hunger countries'. According to Human development index, Bangladesh exceeded the HDI 0.500 score in 2008and still included in the 'group of 'low human development countries'. Moreover, poverty among illiterate, literate and landless people is also decreases in 2000s.

In south Asian region, Bangladesh has the highest level of income poverty (31.5 percent) comprising the highest number of extreme (43 percent) as well as moderate (76 percent) poor population followed by India (29.8 percent). On the other hand, the lowest number of extreme as well as moderate poor lives in Sri Lanka (8.9 percent).

In addition, Multi-dimensional poor are higher in Bangladesh while it secures the third position in hunger index in this region. According to Human development report, Bangladesh occupied the fifth position (0.515 HDI score) in reducing human poverty in this territory.

²⁵¹ **10 VIII.**

252 11 Recommendations

This article finds that, though the head count ratio of poverty decreases, but the income inequality rises. To 253 reduce income inequality, Government should take pro-poor policy to increase the access to credit, opportunity to 254 participate in economic activities and equitable distribution of resources. Moreover, Education must be ensured 255 for the poor people because research found that, poverty is lower among the literates' people. Education also 256 257 contributes to health and productivity. Higher level of employment can reduce the income gap, so both labor 258 as well as capital intensive industry should be facilitated by the government to create employment. Government 259 can strengthen the youth development center to make the labor force more efficient. Special emphasis on health care is needed to increases the productivity of people which may reduce human poverty. Finally, Government 260 should fix target to reduce poverty faster than other countries in the south Asian region. 261

²⁶² 12 IX.

263 13 Conclusion

The poverty in Bangladesh decreases during the last four decades. The declining rate became faster after 1990s 264 and reached to 30 percent poverty in 2010. The fastest poverty reduction was attributed to the expansion of 265 labor-intensive Exports (such as garments and fisheries) business and the increase in employment in the rural 266 nonfarm sector comprising Small and cottage industries, construction and other non-tradable services. To reduce 267 the poverty, the development of all sectors is needed to boost up the employments and productivity. Finally 268 we have to recognize that, Poor people are none but our neighbors. So Government of every country and the 269 development agencies of the world should take initiative to eradicate extreme poverty. Otherwise, this world 270 would be a hell instead of a peaceful living place ¹ 271
