6 Abstract

Academic achievement of students especially at the secondary school level is not only a 7 pointer to the effectiveness or otherwise of schools but a major determinant of the future of 8 youths in particular and the nation in general. The medium through which the attainment of 9 individuals and the nation's educational goals can be achieved is learning. Learning outcomes 10 have become a phenomenon of interest to all and this account for the reason why scholars 11 have been working hard to unravel factors that militate against good academic performance. 12 The purpose of this study was to investigate the class size and school climate as correlates of 13 secondary school students' scholastic achievement in Itesiwaju Local Government Area of Oyo 14 State, Nigeria. Descriptive research design was used in the study. Six hundred respondents 15 were selected from selected secondary schools in Itesiwaju Local Government Area of Oyo 16 State, Nigeria. The respondents were measured with relevant standardized scale (instruments) 17 which include class size scale, school climate scale and student performance scale with strong 18 reliability coefficient and the data obtained was analyzed using Pearson Product Moment 19 Correlation (PPMC) statistical analysis of the Statistical Package for the Social Science 20 (SPSS). Two research hypotheses were raised and answered in the study. 21

24 1 Introduction

25 cademic achievement of students especially at the secondary school level is not only a pointer to the effectiveness or otherwise of schools but a major determinant of the future of youths in particular and the nation in general. 26 The medium through which the attainment of individuals and the nation's educational goals can be achieved is 27 learning. Learning outcomes have become a phenomenon of interest to all and this account for the reason why 28 scholars have been working hard to unravel factors that militate against good academic performance ??Aremu & 29 Sokan, 2002). This phenomenon has been variedly referred to in literature as academic achievement, or scholastic 30 functioning. Academic achievement of learners has attracted attention of scholars, parents, policy -makers and 31 planners. Adevemo (2001) opined that the major goal of the school is to work towards attainment of academic 32 excellence by students. According to him, the school may have other peripheral objectives; emphasis is always 33 placed on the achievement of sound scholarship. Besides, virtually everybody concerned with education places 34 35 premium on academic achievement; excellent academic achievement of children is often the expectation of parents 36 ??Osiki, 2001). At the outset of an activity, students differ in learning as a function of their prior experiences, 37 personal qualities and social supports. The latter includes the extent that parents and teachers encourage them 38 to learn, facilitate their access to resources necessary for learning, and teach them strategies that enhance skill acquisition and refinement. Parent's academic aspirations for their children influence their children's academic 39 achievements both directly and indirectly (Bandura, ??arbaranelli, Caprara, and Pastorelli, 2001). 40 Class size is an important factor with respect to academic performance of students. There is a consensus 41

42 among researchers and educational scholars that, student's achievement decreases as class size increases. The 43 effect of class-size on cognitive achievement has been debated and researched for secondary school level is not only a pointer to the effectiveness or otherwise of schools but a major determinant of the future of youths in particular and the nation in general. The medium through which the attainment of individuals and the nation's educational goals can be achieved is learning. Learning outcomes have become a phenomenon of interest to all and this account for the reason why scholars have been working hard to unravel factors that militate against good academic performance. The purpose of this study was to investigate the class size and school climate as correlates of secondary school students' scholastic achievement in Itesiwaju Local Government Area of Oyo State, Nigeria.

Descriptive research design was used in the study. Six hundred respondents were selected from selected secondary schools in Itesiwaju Local Government Area of Oyo State, Nigeria. The respondents were measured with relevant standardized scale (instruments) which include class size scale, school climate scale and student performance scale with strong reliability coefficient and the data obtained was analyzed using Pearson Product Moment Correlation (PPMC) statistical analysis of the Statistical Package for the Social Science (SPSS). Two research hypotheses were raised and answered in the study.

The result showed that there was significant relationship between the class size and secondary school students' scholastic achievement (r=.883; P<0.05) and there was significant relationship between the school climate and secondary school students' scholastic achievement (r=.755; P<0.05).

60 On the strength of these findings, it was stressed and advocated the need for the public and private schools to 61 develop moderate and appropriate class size for the student in the school and that they should make the school 62 climate and environment conducive for the students' scholastic achievement and overall development in the school. This will help in reducing the level of poor students' scholastic achievement and drop out in the school. many 63 years, this has been inconclusive. Class size refers to educational tools that can be used to describe the average 64 number of students per class in a school. In emphasizing the importance of class-size to the learning teaching 65 process, ALL Nigerian Conference of Principals of Secondary Schools (ANCOPSS) recommended a maximum of 66 forty students per class for efficient and effective teaching. 67

Adeyemi (2008) in his findings on the influence of class size on the quality of output in secondary schools 68 revealed that schools having an average classisze of 35 and below obtained better results in the secondary 69 school certificate examination (SSCE) than schools having more than 35 students per class. 70 Oguntove (2011) in his own study found that class-size had negative coefficient with student's academic performance 71 in examination. Earthman (2002) revealed that comfortable classroom temperature and smaller classes enhance 72 73 teachers' effectiveness and provide opportunities for students to receive individual attention, ask more questions, 74 participate fully in discussion, reduce discipline problems and perform better than students in schools with larger classes. Fafunwa (2010) postulated that there is a gap in the quality of students in crowded classrooms, using 75 inadequate and absolute equipment, disillusioned teachers. These combined deficiencies perhaps affected the 76 student's academic performance. ??deyela (2000) found in her study that large class size is not conducive for 77 serious academic work. Similarly, Egede (2005) pointed out that an alarming class-size of 100 or more students 78 in the secondary schools leave the teacher overworked and therefore unable to exercise patience and positive 79 attitude. They are also reluctant to offer extra time to build and help the intellectually ill students. ??joawo 80 (2008) in one of his major findings revealed that the class size was found to be negatively related to school 81

82 academic performance.

Coleman (2002) pointed out that for enthusiastic teachers, "If classes are very large, it is important that as far as possible, the learners should be constantly busy and the tasks should function continuously without repeated intervention from the teacher". Broozer and Rouse (2001) considered finance, class size, teacher quality, length of school year and technology as factors that can improve student's academic outcomes. They suggested that money is crucial when it comes to public schools matters and that small class size yield better achievement. Yara (2010) in his study on class size and academic achievement of student found out that the performance of students in large classes was very low (23%) compared to those students in smaller classes (64%).

In many cases, the quality of the learning environment was strongly correlated with pupils' achievement
in mathematics ??Carron & Chau, 2006). Two aspects of school climate which are commitment to school and
positive feedback from teachers have been shown to affect students' learning gain in Mathematics (Hoge, Asimeng,
Boahene, 2000). The social emotional Aclimate of schools is predictive of mother's reports of their school age
children alcohol use and psychiatric problems ??Kasen, Johnson & Cohen, 2000).

Furthermore, researchers have found that positive school climate are protective factors for boys and may supply 95 high-risk students with a supportive learning environment, yielding healthy development, as well as preventing 96 antisocial behavior ??Haynes, 2000; ??uperminc et al., 2001). School climate research suggests that positive 97 interpersonal relationships and optimal learning opportunities for students in all demographic environments can 98 increase achievement levels and reduce maladaptive behavior ??McEvoy & Welker, 2000). Regarding the roles of 99 teachers and administrators, Taylor and Tashakkori (2006) found that a positive school climate is associated with 100 increased job satisfaction for school personnel. Finally, student perspectives are important during the transition 101 from one school level to another. Attending a new school can be frightening for students and this apprehension 102 can adversely affect students' perceptions of their school's climate and learning outcomes. Therefore, research 103 has shown that providing a positive and supportive school climate for students is important for a smooth and 104 easy transition to a new school ??Freiberg, 2000). 105

¹⁰⁶ Previous school climate research supports the conclusion that many factors comprise this complex concept.

¹⁰⁷ Furthermore, school climate can play a significant role in providing a healthy and positive school atmosphere. ¹⁰⁸ Freiberg (2000) note that the interaction of various school and classroom climate factors can create a fabric of

¹⁰⁹ support that enables all members of the school community to teach and learn at optimum levels. It has been

found that a positive school climate can yield positive educational and psychological outcomes for students and

school personnel. Similarly, a negative climate can prevent optimal learning and development ??Freiberg, 2000

¹¹² 2 a) Statement of the Problem

As noted by some researchers, academic achievement difficulties of students have been a recurring concern for secondary school education worldwide for various reasons, including the assumption that an improvement in achievement implies a higher graduation rate and the financial implications of students' scholastic achievement (that is, the academic dismissal of students due to poor scholastic achievement) can have negative effect on the budget of education. In particular, poor scholastic achievement can influence the reputation of a school because academic success is associated with the quality of the school. The alarming rate of failure in our secondary

119 schools is highly embarrassing.

In view of the points above, the study focuses on class size and school climate as correlates of secondary school students' scholastic achievement in Itesiwaju Local Government Area of Oyo State, Nigeria.

¹²² 3 b) Purpose of the Study

The main purpose of this study is to investigate class size and school climate as correlates of secondary school students' scholastic achievement in Itesiwaju Local Government Area of Oyo State, Nigeria. Specifically, other

125 purposes of the study include to;

1. Examine the relationship between class size and secondary school students' scholastic achievement.

¹²⁷ 4 Examine the relationship between school climate

128 and secondary school students' scholastic achievement.

¹²⁹ 5 c) Research Hypotheses

130 1. There will be no relationship between class size and secondary school students' scholastic achievement.

2. There will be no relationship between school climate and secondary school students' scholastic achievement.

¹³² 6 d) Significance of study

This study will be highly important to the government at all level, the parents, educational planners, decision and policy makers as well as other stakeholder in education.

However, this study will help the public and private schools to know and ascertain the influence of class size on the students' scholastic achievement, thereby making the stakeholders to develop appropriate strategies in solving the classroom overcrowding in the school and as well enhance the students' scholastic achievement.

The study will provide an insight understanding for the public and private schools to know the effect of school climate on the students' scholastic achievement, thereby making the school stakeholders to develop appropriate ways of improving the school environment for the students in the schools.

141 Through this study, the students as well as the teachers will be able to know the effect of class size and school 142 climate on the students' scholastic achievement.

The class size and school climate as correlates of students' scholastic achievement will enable the government and the general public to be aware of the effects of these factors and work towards better improvement.

145 It is important to note that findings in this study will also serve as a source of reference for other researchers 146 who may want to conduct the same or similar study in other subjects or part of the country.

147 **7 II.**

¹⁴⁸ 8 Methodology a) Research Design

The research design used in this study was descriptive study. It is going to ascertain the effects of the independent variables (class size and school climate) on the dependent variable (students' scholastic achievement) without manipulations. However, it is carefully observed and recorded information as it naturally occurred at the time the study was conducted.

153 9 b) Population

The population for the study comprises of all secondary school students in Itesiwaju Local Government Area of Oyo State, Nigeria.

¹⁵⁶ 10 c) Sample and Sampling Techniques

The sample for this study comprises 600 participants which were randomly selected from secondary school students Itesiwaju Local Government Area of Oyo State, Nigeria. Fifteen (15) secondary schools were selected from the Local Government through stratified random sampling techniques. Forty (40) secondary school students were selected from Volume XIV Issue III Version I 17 () fifteen (??5) selected schools through stratified random techniques balloting. On the whole, six hundred secondary school students were selected.

¹⁶² 11 d) Instrumentations

The school climate scales constructed by Sukkyung, Meagan and Michael (2008) was adopted to be used as a measure of school climate questionnaire. It is a twenty items scale with responses anchored base on the four likert points. The estimate of internal consistency of the instrument was 0.81.

The Class size scale constructed by Ogunwuyi (2011) was adopted to be used as a measure of school climate questionnaire. It is a twenty items scale with responses anchored base on the four likert points. The estimate of internal consistency of the instrument was 0.78.

A self constructed scale was used to measure the students' scholastic achievement. The scale was developed 169 questions in English Language, Mathematics and Basic (General) Science. Also, writing of test items was followed 170 171 by face and content validation. The face and content validation reduced the items from sixty eight to thirty, while item analysis reduced the test items from thirty to twenty five. The twenty five surviving items were 172 administered on thirty students. Kuder-Richardson formula (KR) was applied to the scores in order to measure 173 the internal consistency. The internal consistency coefficient was 0.79; and also a test-retest method was used on 174 the students, with an interval of three weeks, which yielded scores that were paired and analyzed to obtain 0.82 175 as test-retest reliability coefficient for the test. Again, these were considered high enough to accept the test as a 176 reliable research instrument. 177

¹⁷⁸ 12 e) Validity of Instrument

For content and face validity of the instruments that was designed for the study, the researcher gave the
instruments to experts in the field of educational psychology and experts in the area of Research and Statistics.
After all these people had given their suggestions and made necessary correction on the instrument, the researcher

182 then subjected it to the colleague who made the final corrections.

¹⁸³ 13 f) Reliability of Instrument

After content and face validity of the instruments, twenty (20) copies of the instruments was administered in order to re-establish the psychometric property of the instrument. The cronbach alpha technique was then used to test their reliability to ensure that they are consistent in measuring what they were designed to measure. The results from the analysis carried out yielded the following on each Variable:

1. Class Size Scale: 0.78 2. School Climate Scale: 0.80 3. Scholastic Achievement Scale: 0.76

¹⁸⁹ 14 g) Procedure for Data Collection

The instruments were administered to the participants on the day approved by the school authorities for the exercise. The researcher was assisted by trained research assistants in the administration and collection of the instruments. In each of selected school, the administration and collection of instruments were done on the same day of administration. The instrument was administered on the participants in their various schools by the researcher with the support of the trained research assistants in the schools.

¹⁹⁵ 15 h) Data Analysis

¹⁹⁶ The Pearson Product Moment Correlation (PPMC) statistical analysis was used to analyse the data.

197 **16 III.**

198 17 Results

Research hypothesis one: There will be no significant relationship between the class size and secondary school students' scholastic achievement The table 1 above showed that there was significant relationship between the class size and secondary school students' scholastic achievement (r=.883; P<0.05). This means that class size influence the level secondary school students' scholastic achievement.

Research hypothesis two: There will be no significant relationship between the school climateand students' academic performance The table 2 above showed that there was significant relationship between the school climate and secondary school students' scholastic achievement (r=.755; P<0.05). This means that school climate influence the level of secondary school students' scholastic achievement.

207 IV.

208 18 Discussion

The result of the first research hypothesis revealed that there was significant relationship between class size and 209 secondary school students' scholastic achievement (r = .883; P<0.05). This means that class size influence the 210 level of secondary school students' scholastic achievement. This is in line with the studies of Adeyemi (2008) in his 211 findings on the influence of class size on the quality of output in secondary schools revealed that schools having an 212 average class-size of 35 and below obtained better results in the secondary school certificate examination (SSCE) 213 than schools having more than 35 students per class. Oguntoye (2011) in his own study found that class-size 214 had negative coefficient with student's academic performance in examination. Earthman (2002) revealed that 215 comfortable classroom temperature and smaller classes enhance teachers' effectiveness and provide opportunities 216 for students to receive individual attention, ask more questions, participate fully in discussion, reduce discipline 217 problems and perform better than students in schools with larger classes. Fafunwa (2010) postulated that there 218 is a gap in the quality of students in crowded classrooms, using inadequate and absolute equipment, disillusioned 219 teachers. These combined deficiencies perhaps affected the student's academic performance. ??deyela (2000) 220 found in her study that large class size is not conducive for serious academic work. Similarly, Egede (2005) 221 pointed out that an alarming class-size of 100 or more students in the secondary schools leave the teacher 222 overworked and therefore unable to exercise patience and positive attitude. They are also reluctant to offer extra 223 time to build and help the intellectually ill students. ?? joawo (2008) in one of his major findings revealed that 224 the class size was found to be negatively related to school academic performance. 225

The result of the second research hypothesis revealed that there was significant relationship between school 226 climate and secondary school students' scholastic achievement (r = .871; P<0.05). This means that school climate 227 influence the level of secondary school students' scholastic achievement. This is in line with the studies of Taylor 228 and Tashakkori (2006) found that a positive school climate is associated with increased job satisfaction for school 229 personnel. Finally, student perspectives are important during the transition from one school level to another. 230 231 Attending a new school can be frightening for students and this apprehension can adversely affect students' perceptions of their school's climate and learning outcomes. Therefore, research has shown that providing a 232 233 positive and supportive school climate for students is important for a smooth and easy transition to a new school ??Freiberg, 2000). Previous school climate research supports the conclusion that many factors comprise this 234 complex concept. Furthermore, school climate can play a significant role in providing a healthy and positive 235 school atmosphere. Freiberg (2000) note that the interaction of various school and classroom climate factors 236 can create a fabric of support that enables all members of the school community to teach and learn at optimum 237 levels. It has been found that a positive school climate can yield positive educational and psychological outcomes 238 for students and school personnel. Similarly, a negative climate can prevent optimal learning and development 239 ??Freiberg, 2000 240

241 **19** Conclusion

Base on the findings of this study, persistent poor scholastic achievement of Nigerian secondary school students due to class size and school climate should not continue indefinitely. There is hope that with the improvement of class size and school climate, the situation can be changed for the better. The study discovered that class size and school climate influence significantly the secondary school students' scholastic achievement in the society. As such, it is very crucial to improve these factors (class size and school climate) so as to eradicate the persistent

²⁴⁷ occurrence of poor secondary school students' scholastic achievement in this great country, Nigeria.

school climate and student absenteeism (Rumberger, 2007;	
16	
Volume XIV Issue III Version I	
) (
; Kuperminc et al., 2001; Kuperminc,	
Leadbeater & Blatt, 2001; Manning & Saddlemire, 2004).	
Manning and Saddlemire (2004) conclude aspects of	
school climate, including trust, respect, mutual	
obligation, and concern for other's welfare can have	
powerful effects on educators' and learners'	
interpersonal relationships as well as learners' academic	
achievement and overall school progress.	What
children learn about themselves in school through	
interactions is equally important as the academic	
knowledge they receive. School climate, if positive, can	
provide an enriching environment, both for personal	
growth and academic success.	
Research has also revealed a relationship	
between school climate and student self-concept	
(Rutter, Felner, Seitsinger, Burns & Bolton 2009). And, a	
series of studies have shown a relationship between
