## 7 **Abstract**

8 The present study was an endeavor to explore the perception of visually impaired about  
9 familial, academic and caregivers support. Study aimed to explore the difference in the  
10 perception of support of visually impaired youth living in the residential institute. A  
11 questionnaire consisting of 28 items was develop through standardizes procedure and used for  
12 data collection. The sample of the study was consisted of 100 students. Among them 28 were  
13 boys and 22 were girls, ages ranged from 15 to 22 years, they belong to different  
14 socioeconomic status. The present study unfold various aspects of familial, academic and  
15 residential life of visually impaired male and female students, experienced lack of social  
16 support by caregivers; visually impaired male students experienced most of problems due to  
17 non cooperative attitude of caregivers; students who stay longer hours in hostel face more  
18 difficulties; students who are receiving higher education face more problems as compared to  
19 students of secondary and intermediate level. Study indicates that visually impaired students  
20 perceived lack of social support due the people those are near to them. Finding of the study  
21 confirm that the performance and attitude of caregivers are not satisfactory, moreover  
22 residential facilities are also not enough.

## 25 **1 INTRODUCTION**

26 Vision is a vital mean of obtaining information from the environment, lack of sight can severely limit a person's  
27 experience. Visual impairment means impairment in vision that, even with correction, adversely affects a  
28 students's educational performance. Visual impairment is a distressing physical condition with profound social  
29 and emotional implications, which consequences affect not only the personage but also the family and the  
30 community. The loss of vision due to any causes major changes in lifestyle, and habits of the blind person  
31 which may result in problems in social and psychological adjustments.

32 According to WHO blindness can define as a physical, psychiatric, intellectual or sensory impairment, whether  
33 temporary or permanent, provided that it lasts for a considerable phase that confines the ability to execute one  
34 or more fundamental activities of everyday life. The term includes both partially sighted and blindness. Visual  
35 impairment creates an obstruction, which consequently lead to dependency. Visual impaired people always  
36 expecting others to lead and take decisions for fear of being rejected. Moreover, they always have to show they  
37 are proficient, but their errors are "forgiven" because they are special.

38 The basic problem faced by the families of handicapped is how to cope with the problems of living in that will  
39 enhance family member's growth and development. The behaviour of the handicapped is shaped by the actions  
40 and attitudes of others and his adjustment in the family can either distort or encourage potential for growth.  
41 In this context the relationship of parents and siblings are most significant. Usually the emotional wellbeing of  
42 the visually impaired children is often not very good in their families and residential institutes due to lack of  
43 intimacy, concern and communication with parents or caregivers.

### 3 METHODOLOGY

---

44 For the visually impaired, to be incorporated into the society the relationships between the visually impaired  
45 and society is very vital. The person and professionals, each at his own level, must allow society to perceive the  
46 handicap itself as well as the person's abilities. For the formation of children's health and behavior features their  
47 emotional comfort in the closest environment their family is important. Probably brothers and sisters more than  
48 parents can understand the interests of visually impaired, satisfy their needs to associate, to play and get new  
49 impressions.

50 As far as the education of visually impaired is concerned, the primary responsibility of the educational  
51 institutions is to provide specialized instruction and services required to meet the unique educational needs  
52 of visually impaired. Teachers can help the student, parents, and special and regular education personnel. For  
53 the education of visually impaired students, special equipments and teaching aid are vital such as largetype  
54 or Braille texts, supplementary materials, educational, aids, and equipment. It is teacher's duty to ensure the  
55 availability of these aids to the visually impaired timely and ensure the student's maximum participation in all  
56 classroom activities parents and other individuals on a regular basis.

57 Emotional ailments and maladaptive behavior of the visually impaired are formed by complex biological and  
58 social factors. These are peculiarities of their individual psychical health, psychical and sensory development as  
59 well as emotional experiences caused by occlusion. Inauspicious surroundings such as, improper family education,  
60 children's unsatisfactory emotional comfort in the family or at special training institutions causes emotional and  
61 behavioral turmoil in the life. Generally individual with visual impairment become anxious due to their life  
62 experiences, such as loss of sight, peer interaction negative caregiver's attitude. According to Eniola (2007)  
63 "generally visually impaired feel anxious because of their visual problems, thinking about how to cope with the  
64 problems of blindness. Moreover visual impairment seem to evoke more awkwardness than more other disabilities  
65 because it is a apparent disability because while walkings visually impaired use a cane, guide dog, sighted guide  
66 and use dark glasses. Eyes also play an important role in social interaction and other people generally feel  
67 uncomfortable to talk with people who they are unable to establish eye contact".

68 Other factors that contributed to the problems of visually impaired include, inadequate teaching and learning  
69 facilities at educational institution, problem of finance, lack of special teaching learning aids. These above-  
70 mentioned factors contributed significantly to the problems of visually impaired.

71 According to ??hagotra, et.al (2008) social support to the blind are important and most important aspect of  
72 social support extended to a blind person include family friends and relatives and the community as a whole.  
73 They further illustrate that social support to the blind includes, accepting them as a useful part of society,  
74 encouraging them to participate in social functions, providing them proper guidance and advice, giving them  
75 physical assistance by sharing their tasks, helping them regain their self-esteem and relieving them of their  
76 attitude of self-pity etc. All this support helps them accept their disability with dignity and makes them socially  
77 cordial, psychologically adaptable and educationally firm.

78 In Pakistan, as far, the education of visually impaired students is concerned govt and nongovernmental  
79 organizations are engaged in this task. Government is spending a lot for the education and rehabilitation of  
80 visually impaired students but there is lack of coordination among federal government, provincial governments  
81 and NGOs institutions. It also fails to provide a barrier-free environment, residential facilities, cooperative  
82 caregivers enough teaching aids and energetic teaching staff to the visually impaired students.

83 The main objective of this research was to investigate the perception of visually impaired youth about familial,  
84 teachers and caregivers support through characteristics of home and institutional experiences. Moreover, it is an  
85 attempt to determine the predicament In Pakistani cultural context in past times, no serious attempts have been  
86 made to explore the perception of visually impaired about the familial, teacher and caregiver's support. Although  
87 many researches were available on the perception of parents and teachers about the handicapped (Shazadi, 1992),  
88 or attitude of people towards the handicapped ??Rashid, 1991). Therefore, it is imperative to understand visual  
89 impaired reaction to social supports, provided by their parents, caregivers and academic in psychological terms.  
90 It also measured the role of certain demographic variables in determining this perception.

## 91 2 II.

### 92 3 METHODOLOGY

93 Present study was delimited to male and female visually impaired students studying in the institutions of special  
94 education. A stratified random sample of 100 male and female respondents was selected from different Govt.  
95 schools and colleges of Lahore and Rawalpindi. For the measurement of visually impaired perception a rating  
96 scale consisting of 3 subscales and 28 items was developed through standardized procedure. It measures three  
97 dimensions of social support, such as familial, academic, and caregivers support, study was an attempt to explore  
98 the perception focusing on: communal understanding, care, educational facilities, social approval, patience and  
99 sharing of responsibility. These factors are considered to be basics for sustaining the feeling of confidence and  
100 trust in one's abilities. The respondents have to rate these statements on 5 point scale strongly disagree (1)  
101 disagree ( ??) undecided (3) agree ( ??) and (5) strongly agree. The higher score on rating scale indicates lack  
102 of social support and more problems experienced by the visual impaired youth.

---

## 103 **4 a) Research problem**

104 The problem to be investigated was to explore the perception of visually impaired youth about familial, academic  
105 and caregivers support, it further aimed to explore the role of certain demographic variables such as, age, gender  
106 income level of education and length of stay in hostel in determining the perceived level of social support.

## 107 **5 b) Research objectives**

108 The main objectives of the research are as under:

109 1. To explore the perception of visually impaired students about familial, academic, and caregivers support.

## 110 **6 d) Population**

111 For this research, the ideal population includes all visually impaired students studying in the public and private  
112 sector schools of Pakistan, but due to limited time and resources, it was not possible to collect data from all of  
113 them. Therefore, for the convenience of data collection, public special education institutions located at Lahore  
114 and Rawalpindi were only selected for the study.

115 level and income level ranged from Rs.10, 000 to Rs.50, 000. Other specifications of the sample are number of  
116 sibling and length of stay in hostel.

## 117 **7 f) Procedure**

118 A stratified random sample of 100 students was collected from the three educational level such as secondary,  
119 higher secondary and graduate. The respondents were contacted in their respective classrooms. They were given  
120 adequate information about the purpose of the study; a rating scale was given to them with request to complete  
121 it in one sitting. The assurance of confidentiality and anonymity was provided to them. 1 reveals percentile  
122 ranks of respondents' scores on the 28 items social support scale. The percentile ranks were calculated in order  
123 to identify the levels of perceived lack of support. The score of 70 falls on 25 th percentile, characterized as a  
124 mild perceived lack support, score of 80 falls on 50 th percentile characterized as the moderate perceived lack of  
125 support and score of 87 falls on 75 th percentile rank characterized as higher perceived lack of support.

## 126 **8 III. STATISTICAL ANALYSIS OF THE DATA RELATED 127 TO THE RESEARCH HYPOTHESES**

128 H1: Visually impaired perceived that they are facing more problems due to caregivers' attitudes than the attitude  
129 of their family and teachers.

130 Table 5 portrays the results of the respondents for the second hypothesis of the study. The results illustrate gender  
131 wise difference in the perception of support. The results presented in this table confirm the research hypothesis  
132 that male visually impaired students perceived more difficulties than the female students because they have  
133 higher mean score on the total score of the research instrument.

134 H3: Students who have longer stay in hostel have more difficulties than those who have less stay in hostel.  
135 Table 7 portrays respondent scores on the variable class. The result illustrates that students of secondary level have  
136 higher score on the total scale; they have also higher mean scores on all subscales. H5: Students of higher income  
137 group perceived fewer problems of support than children with low income group. Table 8 represents the income  
138 wise differences of the scores of the respondents. Results depicted those students who belong to lower income  
139 groups H6: Students with fewer siblings perceived more difficulties than students with more siblings. perceived  
140 more problems due to lack of support as compared with students of higher income groups.

## 141 **9 DISCUSSION**

142 The study was carried out to measure the research objectives. It was focus on the perception of visual impaired  
143 regarding social and institutional support. It also intended to find out the relationship of demographic variables  
144 with perceived lack of support. The result of the study is presumed to be a useful experience for students with  
145 visual impairment, parents, caregivers, teachers, as well as others dealing with such student the excellence of  
146 parent-child interaction provides foundations for cognitive, social and communicative development of children  
147 (Klein et al., 1996; Rye, 1997). Throughout the life, the nature of the person's interactions with family and  
148 friends considered as the engine of development ??Bronfenbrenner, 1986).

149 to explore the perception of visually impaired students about familial, teachers, and caregivers support. The  
150 mean and SD of the respondents on the overall scale were calculated results make it clear that people with  
151 visual impairment have negative perception about familial, teachers, and caregivers support, especially they are  
152 unhappy with the attitude of caregivers.

153 The second objective of the study was to analyze the affects of various demographic variables including,  
154 age, gender, income, class, number of significant challenge in providing services that will enhance successful  
155 post-colleges outcomes. Making appropriate decisions about the development and implementation of social  
156 support for students with visual impairments requires a clear understanding of their unique learning needs  
157 and the interventions. Academic administrators must have knowledge about specialized personnel, materials,

## 11 3.

---

158 equipment and educational settings to ensure appropriate individual educational program planning for this  
159 unique population. Based on the special need of visually impaired student population Following are some  
160 recommendation 1. Parents, siblings, teachers and caregivers may not be treated visually impaired people in  
161 the stereotypical and demeaning manner. They should recognize that each person is unique and different from  
162 every other person, Moreover they should understand that persons who are visually impaired have the same  
163 emotions as everyone else. 2. Parents support and involvement are most important for the visually impaired,  
164 therefore, they may provide appropriate training so they can actively involved in the betterment of their children.

## 165 10 2.

166 Recognize own strengths and weaknesses in a realistic manner and acknowledge both positive and negative feelings  
167 in oneself and in others and appreciate that both feelings are justifiable.

## 168 11 3.

169 Being able to identify and appropriately express their likes and dislikes and being aware of alternative ways to  
170 respond to the feelings and behavior of others. 4.

Feel comfortable asking for help from others when it is appropriate.

171 .1 December

172 Perception of Visually Impaired Youth about Familial, Academic and Caregivers Support

173 The component of support include mutual understanding; acceptance, affection and tolerance; caring and  
174 supportiveness of the parents, siblings, teachers and caregivers. The finding of the research suggested that  
175 student's difficulties are due to nonsupportive teaching learning environment. Moreover, residential institutions  
176 also play an important role in the life of visually impaired. The participants of this research were belongs to a  
177 segregated setting, and reported they often faced non-supportive cognitive-affective and instructional conditions  
178 in educational institution and in residential place. In order to achieve the first objective, siblings and length of  
179 stay in hostel in determine the perception about support. Results revealed that demographic variables affect on  
180 the perception of visually impaired students. In this regard, various hypotheses were formed; findings of this  
181 research validate our research hypotheses.

182 The early psychosocial home environment and the state of the participants' current emotional climate are very  
183 important for the health and positive selfesteem, which has to be cultivated early in life. Low selfesteem is often  
184 cited as the ultimate source of poor academic achievement and self-destructive behavior. Particularly, the type  
185 of early childhood upbringing, early school experiences and peer relations play a vital role in molding the child's  
186 self-esteem ??Safri,1972). Indeed, the opinions of significant adults (parents, teachers etc.) have an impact on  
187 a child's level of self-esteem. In Pakistani cultural context, the visually impaired experience unfavorable social  
188 conditions such as, improper family education, unsatisfactory emotional comfort in the family and special training  
189 institutions, that can leads to distress.

190 V.

191 .2 CONCLUSIONS

192 Findings of the study reveal that 47% visually impaired male and female students experienced lack of social  
193 support. It was also found that visually impaired experienced most of problems due to non cooperation attitude  
194 of care givers in this respect male face more difficulties than female. It was also found that students who  
195 experienced have to stay for longer duration in hostel face more difficulties. Another major finding of the present  
196 study was that students who are receiving higher education face more problems as compared with students of  
197 secondary and intermediate level. The results of the study unfold various aspects of familial, academic and  
198 residential life of visually impaired. Study indicates that visually impaired students perceived lack of social  
199 support due the people those are near to them. Study also concluded that at present there is serious lack of  
200 teaching aids for the visually impaired students. Finding of the study confirm that the performance and attitude  
201 of caregivers are not satisfactory, moreover residential facilities are also not enough. The results of this study  
202 also provide insight into the demographic variables that may influence the perception about the social supports.  
203 Gender, income age seemed to have a statistical significant relationship with negative perception. The results of  
204 this study were in line with the stated hypotheses.

205 .3 VI.

206 .4 RECOMMENDATIONS

207 Visually impaired students have unique learning needs that must be addressed in order to become them  
208 independent and productive citizens of our society. Thus, family and educational institutions face a 3. People  
209 those who are dealing with the visually impaired they should respect and encourage the individuality, capabilities  
210 and independence of the visually impaired youth. 4. Schools/ colleges counselor need to take an active role in  
211 helping visual impaired students to develop appropriate career aspiration and job performance skills. 5. Special  
212 and general educators should treat visually impaired in the same manner as they do the rest of their students.  
213 6. There is lack of teaching aids, such as Braille books, large print material, Perkins brailler, tape recorders  
214 computer and other technological devices for visually impaired. At college level there is serious lack of Braille  
215 books, recorder books may be provided for all subjects at the beginning of the session. 7. Schools, colleges and  
216 the residential institute may provide a barrier free environment for the visual impaired persons. 8. The capacity  
217 of the residential institutions is not according to needs, so the capacity of the existing institutions may be enhance  
218 if possible. 9. The institutions should provide more supportive teaching leaning environment so visually impaired  
219 can perform up to their maximum potential level.
