## Abstract

Cultural industries have become a significant component of modern economies. There is increasing attention measuring the economic contribution of these industries at national levels, particularly their impact on economic variables. The objective of this study is to illustrate concepts, approaches, methodologies related to cultural economics. Moreover, to shed light on measuring methods of the economic contribution of cultural industries. Using descriptive analysis, we examined the use of these approaches in some selected countries. These countries are; UK, Finland, France, Germany, Italy, and Spain from Europe. Canada and USA from North America. Australia, China and India from the Asia-Pacific region. South American economic organization (MERCOSUR) countries for the South American region. South Africa and Egypt from Africa region. The main results revealed the increasing realization of measuring cultural economic contributions in developed countries rather than developing countries. Yet; data limitation is still the main problem of measuring the economic contribution of cultural industries. Furthermore, for international comparison purposes, there is a real need to develop new common concepts and measurements of the economic contribution of cultural industries.

**Index terms**— cultural economics, cultural industries, economic growth, economic impacts, economic

## 1 Introduction

here is considerable interest to measure the economic contribution of creative and cultural industries at national levels, particularly their impact on GDP (Gross Domestic Product), GVA (Gross Value Added), employment, and hence the impact on economic growth. Moreover, these impacts are extended to foreign trade, competitiveness, and foreign direct investment (FDI).

Nowadays, cultural industries have become an important component of modern economies and knowledge societies due to their impact on society's development, as the cultural sector may generate two types of impacts: non-economic and economic. The non-economic impacts could be realized in social cohesion and integration of marginalized groups; constructing of a new value system; supporting the creativity and talents, the evolution of cultural diversity and national identity. Moreover, facilitating innovation. While the economic impacts appeared in stimulating economic growth, enhancing both foreign trade competitiveness and foreign direct investments (FDI), as we previously mentioned.

The objective of this study is to illustrate concepts, approaches, methodologies related to cultural economics. Particularly, shedding light on measuring approaches of the economic contribution of cultural industries, referring to these approaches in some selected countries. These countries are; UK, Finland, France, Germany, Italy, and Spain from Europe. Canada and USA from North America. Australia, China, and India from the Asia-Pacific region. South American economic organization (MERCOSUR) countries for South America region. South Africa and Egypt from Africa region.

In light of the above, our study is divided into five sections, in addition to the introduction (Section I). Section(II) is devoted to Terminologies and Conceptual framework. Section (III) devoted to a brief literature review. Section (IV) discusses different measuring approaches of the economic contribution of cultural industries. Section (V) is devoted to the applications of these approaches in the selected countries previously mentioned. Section (VI) concluding remarks.

## 2 II.

### 3 Terminologies and Conceptual Framework

We will begin with the conceptual definitions related to cultural economics. Figure (1) Illustrates the evolution of these concepts, followed by a brief discussion for each concept, with emphasizing on the most concern: Defining culture was a debatable issue 1 . In the sixteenth-century, culture was considered as enlightenment of society's mind and intellect 2 . Yet, in the nineteenth century, the "culture" term had been used in a broader sense, describing intellectual and spiritual development of society's civilization 3 Some definitions of "culture" were so narrow as to be restrictive in light of phenomena description. While other definitions were broader, where "cultural" has two broader definitions: first is the anthropological or sociological framework, that describes "culture" as a set of attitudes, beliefs, mores, customs, values, and practices which are common to any group, this group may be defined in terms of politics, geography, religion, ethnicity or some other characteristics . 4 1 For instance, culture was described as "one of the two or three most complicated words in the English language." Borofsky also described culture as "akin to trying to engage the wind." So, "Culture" was a word employed in various senses in use, but without generally agreed core meaning. For social science, "Culture" was related to concepts of humanities and social sciences, but it was deployed without precise definition (Throsby, 2001). 2 Such use of "culture" meaning is still in practice, where we refer to someone who is having well knowledge in arts as a "cultured" or "cultivated." And also, the noun "culture" is used without qualification, denoting products and practices of "high" arts ( Throsby, 2001). 3 The culture definition during this period focused on these characteristics for societies, such as nation-states. So, this humanistic interpretation of culture was set to become more expressed for the society's life and arts (Throsby, 2001). 4 For example, Mexican culture, Basque culture, Jewish culture, Asian culture, feminist culture, corporate culture, youth culture, and so on. The characteristics which define the group may be established in the forms of signs, symbols, texts, language, artifacts, oral and written tradition, or by other means.

. The second is functional definition; stated that "culture" has functional orientation, denoting certain activities performed by people, and the products of these activities, which are related to intellectual, moral and artistic aspects of human life. According to this definition, "culture" is related to activities that are devoted to the enlightenment of mind, rather than the acquisition of purely technical skills. The definition is more probably in "cultural goods," "cultural institutions," "cultural industries" or the "cultural sector of the economy". 5 According to the functional definition; we can determine cultural activities as follows: the arts as traditionally defined: music, literature, poetry, dance, drama, visual art, ..etc. In addition, activities such as filmmaking, story-telling, festivals, journalism, publishing, television and radio, and some aspects of design For our study, we will depend on the functional definition. 6 Recently, the key role of the cultural sector has been emphasized and recognized for its importance in economic fields (Throsby, 2001). 7 5 For more accuracy to the second definition, the notion contained in the "culture" term could be derived from three suggested characteristics of the concerned activities, these characteristics are: (i) activities involve some form of creativity in their production. (ii) activities concerned with generation and communication of symbolic meaning, and (iii) activities that their output embodies some form of intellectual property. Yet, there have been debates among cultural economists about the classification of "culture goods," which are differentiated from "ordinary economic goods." (Throsby, 2001). 6 Yet, an activity such as scientific innovation would not be involved in this definition because it is considered utilitarian rather than communicate the meaning. Moreover, road signs may give symbolic meaning but not considered cultural products. Organized sports festivals are ambiguous; some economists may find difficulties in accepting it as a cultural activity. Nevertheless, there can be little doubt that sport is an element of culture, which is a custom expressing shared values and as means of emphasizing group identity (Throsby, 2001). 7 The 2006 KEA report; addressed The Economy of Culture in Europe, aimed to shed light on the culture sector's importance by showing how culture leads to economic and social development driven by innovation and cohesion. The UN report (2010) also referred that: "adequately nurtured, creativity fuels culture infuses a human-centered development and constitutes the key ingredient for job creation, innovation and trade while contributing to social inclusion, cultural diversity and environmental sustainability." This discussion revealed how expressive value is concentrated in the core creative fields, realizing how it extended to creative industries and the economy (KEA, 2006).

. The researchers' interests in this field focused on measuring the socio-economic performance of the cultural sector. Furthermore, public perception continued to view the arts as a matter of enlightenment or entertainment, which may be led to a marginalized view of the sector in terms of its economic contribution, and thus limited the public view analysis. This limited view may explain the lack of statistical tools available to measure the economic contribution of the cultural sector (KEA, 2006).

---

## 4 b) Culture and Economics

As we previously discussed, and for the analysis objective, we will depend on the functional definitions of "culture" (p. 3). So, we can define the interrelationship between economics and culture as follows: the beliefs, attitudes, and values that bear on the economic activities of individuals, organizations, and other institutions <sup>8</sup> (Porter, 2000). Although the relationship between economics and culture was debatable <sup>9</sup> Another point we should mention is the broad literature of the relationship between culture and economics, which was later called "cultural Economics." The first step of "cultural Economics" as a discipline was established in 1965-1966, with the publications of Baumol and Bowen's titled: "On Performing Arts: Anatomy of their Economic Problems"; "Performing Arts: The Economic Dilemma." Later, Blaug pioneered the "economics of arts" in the 1970s, he started his work with comprehensive "cost-effectiveness analysis" to reveal the allocation of public subsidies for arts (King and Blaug, 1973). Blaug also gave the main contribution to what we called "cultural economics." He pointed out achievements, gaps, and desirable impacts of cultural economics on the economy, economic impacts of culture were evident. These impacts have three main paths: first, historical component, made by habits and values received from parents and earlier generations. The second, contemporaneous component, represented by beliefs generated by social interactions and networking (Marini, 2016; 2013). Third, evident in the direct and indirect economic impacts of cultural industries and their activities. <sup>8</sup> In this context, culture is considered different beliefs, such as religious creeds, social beliefs and norms, habits, and values transmitted over generations through social interactions and intergenerational transmission that influence individual decisions and policies of countries and regions. Nowadays, it is recognized that cultural types represent important determinants for the study of both individual decisions and macroeconomics (Marini, 2016; 2013). <sup>9</sup> According to literature; some economists supported the direction of relationship from economic development to culture (Marx, 1859; Inghleart, 1990; 1997), while other economists suggested the reverse direction of impacts from culture to economic development (Banfield, 1958; Putnam et al., 1993; Fukuyama, 1995; Tabellini, 2010), and others stated that the relationship between culture and economics interpreted as bidirectional (Dasgupta, 2003). <sup>10</sup> Blaug is better known for his work about the history of economic thought and economic methodology. Yet, his publications on the economics of art and culture illustrated his contribution in culture economics and its relationship with applied economics (Handke and Dekker, 2013).

. He also confirmed the importance of analysis for costs and benefits to provide main framework for cultural policy. Moreover, Blaug stressed the special role of cultural economics for economic theory <sup>11</sup> . By 1976, It was evident that there was a new field of economics that was emerged when Blaug focused on economics of arts in a narrow sense <sup>12</sup> , he referred to the exclusion of television and radio with a distinction between "entertainment" and the arts. A year later, the North American Academy established the Journal of Cultural Economics (JCE) (Handke and Dekker, 2013). By 2001, cultural economics began to cover an increasing range of "artistic phenomena" that justified the shift from "economics of arts" to "cultural economics" <sup>13</sup>

## 5 c) Cultural Industry (Industries)

. The first use of the "cultural Industry" term was in 1947 <sup>14</sup> , describing arts and cultural goods that could be industrialized. This term was widely used in modern society's life, and it was picked up by French sociologists (UNESCO, 2012). Recently, "cultural industries" is converted to "creative industries" by policymakers (p. 9). Evolution the term "cultural industries," was made by shedding light on the production and consumption of cultural activities; especially arts, which are characterized as purely economic processes <sup>15</sup> <sup>16</sup> Blaug was affected by Austrian Karl Popper; he believed in the cultural sector as a type of Australia, a foreign place where black swans dwell. Moreover, Schumpeter also gave inspiration to Blaug; he argued that the topics of innovation, entrepreneurship, and Schumpeterian competition should have a central role in economics (Handke and Dekker, 2013). <sup>12</sup> Arts in a narrow meaning are: "opera, ballet, modern dance, orchestral concerts, theater, museums and galleries, but unfortunately not television, radio and films, and not jazz or pop music." Blaug explained the exclusion of television and radio with a distinction between entertainment and the arts. He concedes immediately that this distinction may be "artificial and conventional," but it is necessary to avoid the inclusion of spectator sports, which would leave the scope too broad. The film is excluded for a different reason: there were no concise economic studies available. Jazz and pop music are excluded because of the "deplorable" lack of interest of professional economists for these topics at the time. Cultural economics continues to struggle with the definition of the arts, the cultural, creative industries, or entertainment industries to this day. Moreover, Blaug's solution was by admitting the absence of definite criterion (Handke and Dekker, 2013). <sup>13</sup> Blaug (2001) emphasized advances in economic theory to cover more comprehensively the full range of "outlets of artistic creativity." So, he focused on the branch of cultural economics that use a broader, the anthropological definition of "culture," emphasizing norms and values (Klamer, 1996; Throsby, 2001). As we previously discussed (p. 3). <sup>14</sup> Frankfurt School of Sociology pioneered the "cultural Industry" term, Particularly in criticism of economization of art by Adorno and Horkheimer book: "Dialectic of Enlightenment," which described cultural industry as an art, and cultural goods that could be industrially multiplied (Throsby, 2001; UNESCO, 2012). <sup>15</sup> According to this evolution, the root of cultural economics was established as a distinctive discipline in economics. Since then, cultural economics had its economic classification, and also had its international association, congresses, and journal (Journal of Cultural Economics (JCL)) (Throsby, 2001).

Later, cultural economics researches have been conducted, with expanding theoretical and applied literature framework in both cultural industries and their economic impacts (as we will discuss in part III). These researches traced the modern origins of Galbraith's first writings of economics and art in 1960, also Baumol and Bowen's work in 1966. In this tradition, cultural industries were interpreted using traditional tools of economic analysis, with some adaptations for the features of cultural demand and supply. The researchers also revealed two types of the culture industries' impacts; The non-economic and economic impacts. The non-economic that cultural industries have on social development can be realized in the social solidity and integration of marginalized groups (Council of Europe, 1998; Matarasso, 1997); building of a social values systems (Ingelhart, 2000); creativity, talents emphasis (Throsby, 2001; UN, 2010); development of . According to this approach, cultural industries could be integrated into wider economic models, such as an input-output models, with taking into account relationships between culture and related industries and sectors.

The main idea of these thoughts was that commodification of culture does not crowd out other activities of cultural production and industries. So, the economic view of culture and cultural industries is simply accepted as producing and consuming cultural goods and services within an economic system that is involved in economic transactions, and hence cultural industries could be economically measured and analyzed (Throsby, 2001).

Many types of research have been conducted to make a significant contributions for modeling cultural industries to measure their economic contribution. The baseline of these researches was related to the traditional structure of art, based on criteria of aesthetics theory (Adorno, 1998). A broader perspective added some criteria from the industrial field such as cultural levels and economic value (Throsby, 2008), interactions of the creative workforce (Higgs et al., 2008; Florida, 2004), industrialization level of production (Hesmondhalgh, 2002), and effects of technical progress (Boix et al., 2010). The first prominence of cultural economics as a discipline of economics was in 1960, with Galbraith's book entitled: "The Liberal Hour," and also the work of Baumol and Bowen in 1966, entitled: "Performing Arts: The Economic Dilemma." Since then, several well specialized researches have appeared in this field, and there was an expanding theoretical and applied literature in cultural economics in academic journals (Throsby, 2001). Artists' work is considered as an incident in the labor market, and so, these activities could be analyzed using economic concepts such as labor supply and profit functions. Yet, the predictions of behavior differ from the expected because of the special nature of artists (Throsby, 2001) Bakhshi et al., 2008). The economic impact could be evident in the increasingly important components of cultural industries to modern economies and knowledge-based society, due to their impacts on the economic development (UNESCO, 2012).

By the end of the 1990s, researches conducted in developed countries revealed that cultural industries stimulate Gross Domestic Product (GDP) or Gross Value Added (GVA) and employment; and also have main characteristics as a leading sector, that can stimulate economic growth. The researchers in this field suggested that some cultural sectors (e.g., designs) can provide spillover economic impacts; and also could achieve a high-quality workforce, business, and investment, and stimulate creativity and innovation across all sectors of the economy, which may led to reinvestigate the role of cultural industries' in the and changes of the economies (UNESCO, 2012).

. The growing interest in cultural economies give a key component for cultural industries in formulation of economic policy development. In this regard, there is a growing tendency in several countries; particularly in developed countries, to include different cultural industries aspects (production capacity, creative classification, cultural facilities, etc.) in measuring economic development and economic growth.

In recent decades, there was a greater understanding and measuring of the economic importance of cultural industries. It has become clear that these industries impact GDP, GVA, employment, and economic growth rates. Moreover, they can enhance a country's foreign trade account and competitiveness, contribute to the regeneration of creative cities and attract investments. That was evident in researches that revealed the significant impact of cultural industries on the economy by enhancing economic growth and economic development (Lash and Urry, 1994; Jensen, 1999; Pine and Gilmore, 1999). These trends in economics are represented new terms; "culturalisation," (Ellmeier, 2003) or "creativisation" (Rikalovic and Mikic, 2011). Moreover, researchers shedding light on the central role of the cultural sector as a base of creative economy (UNDP, 2010; Howkins, 2001; Florida, 2002; Conference Board of Canada, 2008).

So, by the first decade of the 21 st century, cultural industries became one of the most dynamic sectors of the global economy, with their expected enhancing for GDP growth. Later, the "cultural industries" term was converted to "creative industries" by policymakers. Creative Economy and Creative Industries (Hesmondhalgh, 2002; Throsby, 2010; Pratt, 2005).

Howkins pioneered the "creative economy" definition in 2001 who defined the creative economy as "the transactions of creative products that have an economic good or service that results from creativity and has economic value" (Howkins, 2001). Yet, the most used definition was by the UK Department of Culture, Media and Sport (DCMS), which defined the creative economy as "those industries which have their origin in individual creativity, skill and talent and which have a potential for wealth and job creation through the generation and exploitation of intellectual property" (DCMS, 1998).

Recently, the United Nations Conference on Trade and Development (UNCTAD) defined the creative economy as a developed concept based on creative assets, and potentially generating economic growth. According to this definition; a creative economy can enhance income generation, employment, and export revenues with

promoting social inclusion, cultural diversity and human development. Moreover; the creative economy also includes economic, cultural and social aspects interacting with technology, intellectual property and tourism objectives and It is a set of knowledge-based economic activities with a development dimension and cross-cutting linkages at macro and micro levels to the overall economy, It is a feasible development option for innovation 20 19 By 2000s, researchers estimated that the creative sector share of the world's GDP was 7.3% (Howkins, 2001) and with an average growth rate of international trade of 8.7% during the period 2000-2005(UNCTAD, 2008). These tendencies, together with changes in broader economic environment and consumption, gave the view of increasing growth of cultural industries in some countries, comparing to other traditional industries (UNESCO, 2012). 20 The "creativity" term appeared in the 20th century by educational theory and psychology, particularly in models of artistic practice and perception, to suggest different forms of learning and understanding. With knowledge economy, Florida and Howkins were placing this knowledge under the banner of the "creative class" and "creative economy" by the 1990s (Oakley, 2009). At the same time, the research provided evidence for linked relationship between creativity and innovation. Oakley, et al. in the NESTA report identified three main ways in which artistic labor is linked to innovation, as follows: Artistic labor has the attitudes and skills that are adopted to innovation. Artistic labor is affected by innovation through the widespread "culturalisation" of activities -as cultural ideas and images become a part of non-cultural products and services. Artistic labour also provides content that is required for "artistic creativity." More recent research, the Nova Scotia Cultural Action Network in 2009, revealed that arts and cultural industries are stimulating the economy in three ways: first, by driving innovation through core creativity and cultural industry activities. Second, by driving the economy through wealth creation. Third, by positively impacting the quality of life in a given region, which in turn attracting more innovators.

, multidisciplinary policy responses and inter-ministerial action, and the creative industries become at the core of creative economy (Canadian Heritage, 2013).

For expanding view of the creative economy, we will briefly discuss "creative industries" term, which used for shedding light on the role of creativity in economic life, and stating that economic and cultural development are not isolated, but actually, it represents a part of a larger process of social and economic development.

The "creative industries" term was initially used in 1994 by the Australian Report entitled Creative Nation 21 , and widely used in 1997 when policymakers of the UK's DCMS established the Creative Industries Task Force (CIFT) 22 In the same context, Scotland's Government suggested that traditional performing arts and cultural organizations are increasingly being involved in the creative content dimensions of the creative economy, especially the playwrights, musicians, and a host of performers, who become more interested in their intellectual property rights, using the social and broadcast media (Knell and Fleming, 2008). This illustrates that most artists move between various projects, businesses, values, aspirations, techniques, . Since then, the relationships between the art, culture sector, and creative industries were debatable. Arts are generally understood as activities and institutions that are subject to public-funded, such as galleries, concert halls, symphonies, and literature (Canadian Heritage, 2013). 21 The concept of creative industries pioneered in Australia in 1994 with the report "Creative Nation: Commonwealth Cultural Policy" (DCA, 1994), where it was discussed in the context of art and communication technology. This concept was accepted at the end of the decade. The spread of the liberal cultural policy in the UK during the 1990s also contributed to stimulating creative activities. Moreover, the interactions between culture and technology became complex, and traditional understanding was not broadly enough to analyze relationships between creativity, cultural value, technology, and their impacts on the economy (UNESCO, 2012). 22 The first use of the "creative industries" term was in 1997 by the UK government; with the establishment a Creative Industries Task Force (CITF), as a center of the Department of Culture, Media and Sport (DCMS). The Creative Industries Task Force set mapping of activities related to the UK creative industries, for trying to measure the contribution to UK's economy (Flew, 2012). In 1998, The UK Creative Industries Mapping Document defined the creative industries as those activities which have their origin in individual creativity, skill, and talent and which have the potential for wealth and job creation through the generation and exploitation of intellectual property (DCMS, 1998). The DCMS identified 13 sectors as constituting the creative industries, these activities are: Advertising, Architecture, Arts and antique markets, Crafts, Design, Designer Fashion, Film and video, Interactive leisure software (electronic games), Music, Performing arts, Publishing, Software and computer services, television and radio (DCMS, 1998). This mapping was broadly repeated in 2001 (UK, DCMS, 2001). The Creative Industries Mapping Document identified the creative industries as constituting a growing component of the UK economy in 1998, employing 1.4 million people and generating an estimated £60 billion a year in economic value added, or about 5% of total UK national income (DCMS, 1998; 2001), particularly in London, the contribution of the creative industries was even greater comparing with other parts in UK, accounting directly or indirectly for about 500,000 jobs, and about 20% of new jobs created, with an estimated value added about £21 billion, this made creative industries London's second-largest economic sector after financial and business services in 2006 (Knell and Oakley, 2007).Volume XXI Issue V Version I 25 ( E )

and products in the day-to-day aspects of their career (Australia Council for the Arts, 2020). Conference Board of Canada also suggested growing understanding and appreciation of relationship between arts, cultural industries, and society. This relation gives creative economy extends beyond the culture sector to bring positive social and economic changes in industries, sectors, and social organizations (Conference Board of Canada, 2008). This new term; creative industries, expanded the scope of what was generally considered as "cultural industries,"

## 7 MEASURING APPROACHES OF THE ECONOMIC CONTRIBUTION OF CULTURAL INDUSTRIES

---

to exceeded arts to potentials of commercial activities (UNCTAD, 2004), what we can be agreed on is that creative industries located in the center of a broader term; that is the creative economy.

For determining our basic terminologies and conceptual framework that are in consistent with our research objective (p.1), we agree on using of the functional concept of culture that we previously referred (p. 3). Moreover, we will use the "cultural industries" term to review measuring approaches of the economic contribution of these industries, while measurement of contribution for broader terms as "creative industries" maybe suggested for other future studies.

### 6 III. Literature Review of Measuring the Economic Impacts of Cultural Industries

The literature of measurement economic contribution of cultural industries is evident in developed countries, other than the rare research for developing countries, Particularly in Africa, as we will discuss later (p. 20; p. 24). There was a lack of measurement of the economic contribution of cultural industries till the 1960s 23 . Yet, by the 1980s, the research emerged driven by the conducted analysis on the relationship between cultural industries and economy 24 (as we previously mentioned in part II), focusing on the quantification of the economic impact of cultural economics on both economic development and economic growth 25 23 There were three reasons for research scarce during this period until the 1960s: first, lack of a statistical data for cultural industries, driven by a view to culture and cultural industries as a new economic discipline. Second, the lack of measurement analysis approaches that could be applied for cultural industries. Third, the debatable relationship between cultural industries and economics, driven by the traditional view of economic analysis, that did not make consistent with the nature of cultural industries and their activities. 24 Prior 1980s, economic impact studies have been conducted on cultural industries in ehe USA to support arguments for public financing of culture, education, and other social science activities (UNESCO, 2012).

. ??? Economic impact studies during this period responded to demand for justification of public financing to cultural activities. This issue had two explanations in the USA: first, the long-established interests of state and local governments in stimulating economic growth. Second, the attitude of "show me in dollars and cents" of local businesses and Since the 1990s, the research interests focused on regional issues or for solving global problems related to intellectual property rights. Later, researchers emphasized on the evolution for the economic measures of economic contribution of cultural industries. In the same context, Anglo-Saxon urban researches were focused on the economic development of cities on cultural industries. These thoughts enhanced the methods and techniques of research in measuring cultural industries' contribution.

Moreover, some researchers discussed the evolution of cultural industries, which may stimulate effective demand in the short run by attracting visitors and local consumers to cultural areas (Bille and Schulze, 2006). Other researches revealed the long-run impacts, driven by attracting firms to invest in the cultural sector (Heilbrun and Gray, 2004). Moreover, cultural industries cluster had also an increasing interest in conducted researches (Hervas-Oliver et al., 2011).

Most researchers focused on the indirect measurement of the economic contribution of cultural industries, other than the direct measurements. Moreover, they also investigated interactions between the cultural sector and other sectors and industries (UNESCO, 2012). While other researchers revealed the role of supply chain linkages (Bakhshi et al., 2008), they also referred to structural relationships in labor markets between cultural and non-cultural sectors (Shafi et al., 2020; Higgs et al., 2008).

IV.

### 7 Measuring Approaches of the Economic Contribution of Cultural Industries

The economic measurement of cultural industries' effects has different approaches, which include several terminologies and indicators 26 ; as illustrated in figure (2), followed by brief distinction for these terms.

investors, who had the main subsidy supports for arts and cultural activities (Heilbrun and Gray, 2004). 26 The measuring approaches of cultural industries' contribution refers to the analytical methods, practices and tools used for collecting, presenting, and interpreting information related to the economic contribution of cultural industries (UNESCO, 2012).

Figure 2

(i) Mapping studies provide an overview of industries, economic value, particularly in industrial sectors that relatively have lack of data about their activities, such as the cultural sector 27 . This approach helps in the data gathering process. Yet, it is not sufficient for measuring the economic contribution or economic impact of cultural industries. (ii) Economic contribution of cultural industries refers to quantification of economic aggregate changes resulting from cultural industries. This concept, also called the economic importance, is static and descriptive, according to its variables and indicators, which are used in the measuring process. These variables and indicators such as Gross value added(GVA), Gross Domestic Product (GDP), employment 28 27 Mapping studies approach emerged in cultural economic field by the UK Department of Culture, Media and Sport DCMS studies (UNESCO, 2012), previously referred to in part (II). 28 The economic contribution as a concept had different interpretations

in the literature studies. Some researchers defined "contribution" as the economic impact in terms of income, expenditure, and value added that generating from sectors to the economy (Jura Consultants, 2008). Watson et al. referred to the economic contribution as the aggregate changes in the economic activities of an industry or net changes driven by a new policy in a certain economy (Watson et al., 2007). Thorsby was more precise; he defined the economic contribution in the cultural economics as a basic approach for measuring the economic effects of cultural industries (Thorsby, 2010).

(iii) Economic impact is a more dynamic concept, which referred to real and potential changes in one variable, driven by changes in another. More precisely, the economic impact measures the net financial flows (Madden, 2001) and strong effects of changes in variables on economic factors, such as consumers, firms, markets, and income (Radich, 1987). Moreover, economic impact reveals the direct and indirect effects of different cultural activities (Bille and Schulze, 2006; Helibrun and Gray, 2004). Watson et al. defined economic impact as net changes in the economic activities of an industry, or net changes are driven by a new policy in an economy (Watson et al., 2007). Thorsby defined economic impact as a concept that has a higher level of analytical insight that can reveal paths which output can be produced and distributed in the economy, and also concluding direct and indirect effects on other related sector in the economy (Thorsby, 2010).

So, this concept can be used at both micro and macro levels. At the micro level, we can use it for studying the short-run impacts of investment in cultural sectors. While at the macro level, we can investigate the impact of cultural industries' activities on other industries, sectors, and therefore effects on the economy.

In light of the above, we can divide the methods of these methodological approaches into two branches: first, for measuring the economic contribution of cultural industries, that includes two methods: economic size and structural analysis, and cultural satellite accounts (CSA). Second, measuring the economic impact of cultural industries, which includes three methods: multiplier analysis, production function, and disequilibrium model (UNESCO, 2012). According to our best knowledge, the methods of the first methodology, economic contribution, did not get sufficient research interests.

## 8 Volume XXI Issue

### 9 a) Economic Size and Structural Analysis

So, for filling the research gap, we will focus on these measurement methods in our discussion. Where these methods give us a broader view of the main and aggregate economic contribution of cultural industries and activities, and also these methods are consistent with our research objective (p. 1). Moreover, measuring the economic contribution of cultural industries at the international level gives the ability for countries to estimate potentials about the evolution of culture industries that are consistent with their society's capabilities and interests. So, we will briefly discuss the methods of the first methodology approach; (i) Economic size and structural analysis. (ii) cultural satellite accounts (CSA).

The main objective of this method is to determine interrelationships and interactions between economic activities and cultural industries, using estimates derived from Satellite National Accounts (SNA), for measuring the direct economic contribution of cultural industries. These estimates, which are relevant to macroeconomic aggregates, are as follows: gross value added (GVA), gross domestic product (GDP), the gross value of production (GVP), employment, fixed capital formation, and foreign trade. According to this method, we can distinguish between two sorts of analysis: the economic size analysis and the structural analysis. The economic size analysis provides a general view of the economic roles of cultural industries. This analysis includes all components of all economic sectors and also focusing on the economic effects of cultural industries in the long run.

## 10 .

Second, the structural analysis, which could be separately conducted, or could be applied as a part of economic contribution studies. This analysis includes different techniques for studying the structure of cultural industries. Economic analysis methodologies focused on firms and industries levels, reaching the whole economy level. It was evident that cultural economists were mostly relevant to microeconomics analysis rather than at the macroeconomic level (UNESCO, 2012). According to this method, macroeconomic aggregates of the culture sector are relatively compared with the size of other sectors in percentages values. This method applied in the case of Germany, Queensland, Australia, and Finland (UNESCO, 2012). Regional economic analysis referred to economic size analysis as contribution analysis (Watson et al., 2007). Yet, the "size" term could be more appropriate to reflect the main objective of this analysis, that determining the economic size and share of cultural industries of an economy (UNESCO, 2012). This analysis concerns with different stages of the value chain, with interest in the distribution of macroeconomics variables by subsectors, groups of stockholders and consumers, such as authors, producers, distributors.

The structural analysis is not limited to data description; it is rather considered as an interpretation of specific policy, markets, and economic aspects (i). Gross value added (GVA): which includes three measures: gross value added as a share of GDP of cultural industries, in absolute terms. These two analyses are used not only for measuring long term contributions of cultural industries but also to measure the short term contributions

## 14 B) CULTURAL SATELLITE ACCOUNTS (CSA)

---

by investing the performance of cultural industries' business, based on operational indicators of business, such as turnover ratio, sales, revenues, profits, number of enterprises, etc.

According to these analyses, macroeconomic variables are used to estimate indicators that are used to specify the economic contribution of cultural industries. The objective of these indicators is to provide reliable measurements for the decision-making process in the culture industries' policy. The main three indicators are as follows (UNESCO, 2012):

### 11 35

. Gross value add as a share of the culture of GDP of culture industries, in relative terms 36 . Distribution of gross value added as a share of GDP by sub-sectors 37 (ii). Employment indicators, which includes four measures: contribution of cultural industries' employment to total employment .

### 12 38

. Distribution of employment in the cultural industry sector 39 . Volume and share of self-employment 40 . Labor productivity in the cultural industry sector 41 . 34 Several types of research referred to structural analysis with other names, such as value chain analysis and cluster analysis. Value chain analysis identifies the relationships between different stages of the value chain in culture industries. Cluster analysis sheds light on the competitiveness of culture industries and their relevant factors, based on four basic factors analysis: strategies of firms and their competitors, demand market, supporting industries, and factor conditions (Porter, 1990). 35 Calculated by dividing the gross value added over GDP of cultural industries in absolute terms (UNESCO, 2012). 36 Calculated by dividing the share of cultural industries in gross value added over GDP of the total economy, in relative terms (%) (UNESCO, 2012). 37 Calculated by dividing the share of culture industries of sub-sectors in total gross value added over GDP of cultural industries, in absolute and relative terms (UNESCO, 2012). 38 Calculated as a share of cultural industries' employees to total employment in the economy, in relative terms (%) (UNESCO, 2012). 39 Calculated as the share of cultural industries sub-sector employment to total employment of cultural industries sector, in absolute and relative values (UNESCO, 2012). 40 Calculated by dividing the number and share of self-employment jobs in cultural industries sector over the total self-employment jobs in the economy (UNESCO, 2012). 41 Calculated as Gross value added (GVA) in cultural industries per employee (UNESCO, 2012).

(iii). Business activity indicators, which include six measures: stock of business 42 . Distribution of business by sub sector 43 . Business startups 44 . Business mortality 45 measurement 46 . Distribution of startup business by sub-sector 47 . Distribution of business mortality 48

## 14 b) Cultural Satellite Accounts (CSA)

The main purpose of satellite accounts systems (SAS) 49 is to measure the economic importance degree of a specific industry. Cultural satellite accounts (CSA) statistically measure the economic contribution of cultural industries in a certain economy 42 Estimated with the number of businesses by size in cultural industries (UNESCO, 2012). 43 Estimated with the number of businesses by size in cultural industries sub-sectors (UNESCO, 2012). 44 Estimated with the number of new businesses in cultural industries per 10,000 persons (UNESCO, 2012). 45 Business mortality occurs in the year when the firm stops reporting sales. This definition is similar to the Bureau of Labor Statistics Business Employment Dynamics measures, which include mergers, acquisitions, and industrial reclassification (Daepf et al., 2015). 46 Estimated with the number of locked businesses in cultural industries per 10,000 persons (UNESCO, 2012). 47 Estimated with the number of new business in cultural industries sub-sectors per 10,000 persons (UNESCO, 2012). 48 Estimated with the number of locked businesses in cultural industries sub-sectors per 10,000 persons (UNESCO, 2012). 49 The satellite account systems (SAS) represent an extension of the system of national accounts (SNA). The (SAS) measure the economic contribution of specific industries, particularly in sectors and for activities that are relatively not observable in traditional (SNA). Such sectors and activities as tourism sector, sports sector, and activities, nonprofit sectors. . CSA also includes both demand and supply sides of cultural industries, based on the Input-Output matrix. It also includes aggregates variables of GDP, intermediate consumption, value-added, and employment. Yet, the investment in cultural sectors is not included because of lack of data about industry classifications in many countries (UNESC, 2012), which made difficulties in using CSA for measuring the economic contribution of cultural industries.

Recently, cultural satellite accounts CSA based on input-output tables, derived and modified to capture the economic contribution of cultural industries (Australia's CSA), or by especial preparation of input-output tables for cultural activities, which based on empirical research about sectorial interrelationships (Colombia's CSA). 50 Lemair Pioneered the conceptual framework of cultural satellite accounts (CSA) for the French National Institute of Statistics and Economic Studies (FNISES) (The Ministry of Education, Finland, 2009). Recently, the (CSA) systems for measuring the economic contribution of cultural industries are widely used in most MERCOSUR

---

countries; Argentina, Brazil, Paraguay, and Uruguay, and also used in some EU countries such as Finland, Spain, and UK (Experian, 2007).

Although widely used, the CSA system faces serious applied problems: First, identification of these industries that are considered as cultural industries, therefore, should be included in CSA 51 . Second, availability of data about Both supply and demand sides for constructing CSA 52 V.

Measuring Approaches in some Selected Countries

. These problems make serious difficulties for using the (CSA) systems in practice at the national level, and also for international comparisons purposes.

In this part, we will discuss approaches of measuring the economic contribution of cultural industries in the selected countries (p. 1). The objective of this discussion is to clarify two main points in the selected countries: First, differences in concepts and activities that include cultural industries. Second, approaches and measures for the economic contribution of cultural industries. The selected countries widely cover different geographical regions. Moreover, they are regionally and internationally the most important countries that realized the importance of cultural industries. Therefore they have considerable literature in this field, and also they applied different modern approaches for measuring the economic contribution of culture industries. These selected countries regionally classified are as follows: UK, Finland, France, Germany, Italy, and Spain from Europe. Canada and USA from North America. Australia, China, and India from the Asia-Pacific region. South American economic organization (MERCOSUR) for South America region. South Africa and Egypt from Africa region (Appendix A. 1; A. 2).

## 15 First: Differences in both concepts and activities, including in cultural industries in the selected countries

The selected countries have various definitions and classifications of cultural industries (Appendix, A.1). This variation led to changes in the scope and perspectives of researches that measure the economic contribution of cultural industries.

Based on the UK classification model, European selected countries agreed on concepts and activities of cultural industries, with conducting initial modification, according to their local needs. Their cultural industries concepts mostly include activities such as: Architecture, film & video, broadcasting (radio & TV), performing arts (theatre, dance, festivals), publishing, music industry, and Advertising. While some other activities, such as sports industries, audio industry, botanical gardens, and zoos, education & training is more included in cultural industries classification for selected European countries, Finland and Spain (Appendix, A. 1). Moreover, some cultural activities are sometimes included in both the culture sector and other sectors 53 For the North America region, the two selected countries; the USA and Canada, almost agreed on cultural industries activities, that include: Architecture, film & video, broadcasting (radio & TV), performing arts (theatre, dance, festivals), publishing, music industry, audio industry, Advertising. While some other activities, such as sports industries, botanical gardens, and zoos, education & training, are not included (Appendix, A. 1). Yet, the definition of arts in the USA includes art councils and cultural organizations that have a non-profit orientation and also have their independent budgets. In the same context, the definition of creative industries in the USA focused on businesses involved in the production or distribution of art products (for-profit and not-for-profit). This definition implies that creative industries include art councils, government agencies, museums, art or science centers, art galleries and art schools (non-commercial), symphony orchestras, theatres, opera companies, performing arts center productions, ballet productions, dance studios, schools and halls, theatre building, ownership, and operation. This concept excludes industries that are creative but not focused on the arts (e.g., computer programming and scientific research (Appendix, A. 1). Another concept in the USA is copyright-based industries, which includes four industries: core copyright industries, partially copyright industries, distribution, and copyright-related industries . 54 Canadian cultural activities concept is based on the stages of the creative chain model. These stages are creation, production, manufacturing, distribution, and support activities . 55 53 These activities such as tourism and cultural tourism, sports, and recreation. 54 Since 2006, this definition has been followed to achieve international standards proposed by World Intellectual Property Organization (WIPO) in 2003, regarding the development of economic and statistical standards to measure impacts of domestic copyright industries (Siwek, 2006). 55 Creative chain model consists of an initial creative idea, which is usually combined with other inputs to produce a cultural good or service that then goes through a series of interlinked stages to reach the user. Cultural goods and services in the creative chain model are represented as hierarchical models, that distinguishes between basic and dependent goods and services, depending on the primary purpose of final product (Statistics Canada, 2011).

. Moreover, Canadian cultural activities are identified according to the level of culturality, including in products. The core of cultural products is that entire cultural chain, and their primary purpose is the transmission of intellectual concepts (Statistics Canada, 2004).

Asia-Pacific region definition of cultural industries based on a combination of UK and UNESCO perspectives and it was established within the "Jodhpur Initiatives." This definition considers cultural industries that produce tangible or intangible artistic and creative outputs, and that have a potential for wealth creation and income generation through investing in cultural assets and production of knowledge-based goods and services (UNESCO,

## 16 SECOND: THE MAIN APPROACHES AND MEASURES FOR THE ECONOMIC CONTRIBUTION OF CULTURAL INDUSTRIES IN THE SELECTED COUNTRIES

---

2005). In this region, most of the selected countries are using creative industries term (Australia, China), which includes broader activities such as: Architecture, Broadcasting (radio & TV), Performing Arts (theatre, dance, festivals), Designs (product, fashion, festivals), Visual arts and art market, Publishing (book, press, journals), The music industry, Software, computer games and multimedia, Internet access providers, Advertising, Jewellery, crafts, and related activities. other than India's cultural industries term; Media & entertainment industries, which only includes activities such as Film & Video, Broadcasting (radio & TV), Music industry, Advertising (Appendix, A. 1).

For MERCOSUR countries in the South American region, the cultural field is used for expressing a broad and dynamic concept, which includes not only activities that produce goods and services with symbolic meaning and value, but also includes broader activities such as artistic training, because these can play a role in the generation of symbolic content (Appendix, A. 1). According to the CSA of MERCOSUR countries, culture production divided into 12 sectors and several subsectors, as follows (i) artistic creation (literary, drama, music, etc.); (ii) performing arts (theatre, dance, live music, etc.); (iii) visual arts (photography, sculpture, graphic arts, industrial arts ..etc.); (iv) books and publishing (books, periodicals, other publications); (v) audio-visual (film and video, radio and television, video games, etc.); (vi) music (music publishing and music recording); (vii) design (architectural, industrial, graphic, textile, fashion, accessories); (viii) games and toys; (ix) tangible heritage (museums, libraries, heritage institutes, etc.); (x) natural heritage (botanical gardens and zoos, natural reserves, etc.); (xi) intangible heritage (festivals and fairs, local languages, cuisine and local culinary traditions, etc.); and (xii) artistic training (UNESCO, 2012).

In African selected countries, cultural industries have a common term, and it is usually including activities such as music industry, crafts, film and television, and the publishing industry (Ghoneim, 2002). cultural industries in a broader sense may include cross-cutting sectors, such as cultural tourism, design and fashion, heritage, gastronomy.

In Africa, cultural industries are represented as interdisciplinary between traditional knowledge, arts, and creative economy. They are organized as household units, working in informal groups. Most the cultural production in some African countries occurs in an informal economy, and this is often the only source of income (UNDP, 2008). In other countries; e.g., South Africa, cultural industries are highly diverse and also characterized by their structure of small firms and concentrated in urban areas (UNESCO, 2012).

### 16 Second: The main approaches and measures for the economic contribution of cultural industries in the selected countries

There are different approaches using for measuring economic contribution of cultural industries across the selected countries. These approaches varied between economic size and structural analysis, cultural satellite accounts (CSA), value chain analysis by subsector, Input-Output matrix, and satellite account creative sector sub-model. All these approaches depend on mapping studies, driven by information availability about the cultural sector (Appendix, A. 2).

In European selected countries, the DCMS model was applied in mapping studies of the UK by the 1990s, based on the value chain concept. This concept includes the creation, production, manufacturing, and distribution of cultural content. Therefore, the value chain model was used as a type of economic analysis. Another approach is employment-based, which measures direct and indirect employment in creative occupations for all industries. According to this approach, There are two ways for measuring the . Moreover, the Finnish model depend on the culturality of goods and services to implement a value chain approach (Ministry of Education, Finland, 2009).

Instead of the value chain model, three-sector model was applied in Germany. These three sectors are private, civil, and public property & management rights. According to this model, measuring the economic contribution of the culture sector, is focused on private sector or market-oriented businesses, and all subsectors related to cultural activities (UNESCO, 2012).

were as follows: Book Publishing Industry (BPI), Music Sound Recording (MSR), Film Production Industry (FPI), Software Industry (SWI) (Ghoneim, 2002). Value chain model had difficulties because national statistics definition of cultural industries that included certain activities at a different level of aggregation. Moreover, this model included different activities (e.g., zoo and botanical garden, wine and food industries), or several stages of the value chain, depending on tradition of cultural sector classification, which may include or exclude dependent activities, such as art agents and auxiliary activities. contribution of cultural employment to economic growth: first, measuring the impact of cultural activities and concentration of creative class on economic growth. Second, the trident model, which is used for measuring direct and indirect employment in cultural industries, applied in UK and France.

In European selected countries, three main measures are used to measure the economic contribution of cultural industries; these are gross valueadded, employment, and the dynamics of business in cultural industries. These economic measures are used in both quantitative and qualitative way and are mainly based on data derived from Satellite National Accounts (SNA).

Economic size and structural analysis was also the main methodological approaches in the selected European countries, which devoted to estimating the direct contribution of cultural industries on macroeconomic aggregates

---

such as GVA, GDP, employment, trade, export, and import) (Appendix, A. 2). This analysis is also combined with structural analysis, based on the availability of data. Moreover, structural analysis is sometimes combined with value chain analysis for explaining the structure and function of different stages of the value chain in cultural industries (UNESCO, 2012).

In the UK, a new model I-O matrix for the cultural sector was constructing in 2007, based on a combination of input-output data. The primary objective of such analysis was to investigate the linkages between cultural sector and the economy in the UK. This kind of analysis is very rare in European countries due to the extensive process of data gathering.

Another method for measuring the economic contribution of cultural industries is cultural satellite accounts (CSA). It was developed in Finland and Spain. In Finland, (CSA) was evaluated in 2005. later, a calculation model for measuring the economic contribution of culture was created. Then, in 2007, a culture satellite account survey was constructed with a computational framework for cultural satellite accounts. This was a very important step in this field, that Finnish CSA inputoutput matrix is based on 60 products and 60 industries out of 90 products and industries included in the SNA and I-O table of the Finnish economy. Yet, the Finnish CSA concept did not include voluntary work, original works of art, general cultural administration, outsourcing, the demand of culture by companies, crafts, games, religious organizations and military bands, open-source activities, education, folk high schools, and Colleges, design, and sport.

(Ministry of Education, Finland, 2009). While in Spain, measurement framework focused on gross value added, the contribution of the cultural sector to GDP, employment, number of firms, net sales, etc. as well as on distinction between private and public sector in measuring economic contribution of cultural and leisure industries, based on anthropological activities such as sports, bullfighting, amusement parks, fairs, lotteries, Volume XXI Issue V Version I

## 17 ( E )

gaming and toys (Ministry of Culture Spain, 2007), these activities provided estimations of economic value and contribution of culture. It was the basis for the development of culture satellite accounts in Spain, published in 2010. The Spanish CSA model is based on a combination of cultural activities and activities related to intellectual property. While cultural activities are the key of this model, it also includes cultural-related activities that are not strictly cultural but essential for the understanding the creative sector as a whole (Ministry of Culture Spain, 2009).

Although these efforts, data limitation is still the main problem in most European countries. As statistics for cultural industries and statistical methodologies have not yet been harmonized in a systematic manner, economic measures of cultural industries can only be interpreted in their local and regional contexts. However, these measures can be effective for analyzing certain areas of cultural industries and their contribution economic growth; they are still not enough as measures for cultural industries' contribution. That may lead to suggest the need for more elaborate evolution to new common concepts and measurements of the economic contribution of cultural industries to be more comparable at both regional and international levels.

In both Canada and United States, approaches for measuring the economic contribution of cultural industries are multiplier analysis and economic size analysis (Appendix, A. 2). In Canada, the economic contribution of culture includes direct, indirect, and induced economic impacts. Direct impacts include the value-added to the economy by firms directly producing cultural goods and services. Indirect impacts include the added value that the "direct impact firms" generate economically through their demand for intermediate inputs or other support services. In contrast, induced impacts are derived when employees of industries (both direct and indirect) spend their earnings and industry owners spend their profits (Conference Board of Canada, 2008). In the Asia-Pacific region, measurement tools of economic contribution for cultural industries are evident in Australia (Appendix, A. 2), based on numerous mapping studies and conducted researches. Moreover, the production chain model is used and also focused on creative activities in Australia. The mapping studies, which used for analyzing cultural industries, were consisting of five stages: pre-creation, creation, realization, consumption, and post-sale. Only the pre-creation and creation stages are including for measuring the economic contribution. In Africa, researches that dealt with measuring the economic contribution of cultural industries are scarce (Snowball et al.). The applied approach for measuring the economic contribution of cultural industries in this region is economic size and structural analysis in both Australia and China (Appendix, A. 2). In contrast, structural analysis is used for studying the structure of the culture studies in India and also for analyzing the distribution of macro-economic aggregates by sub-sectors (UNESCO, 2012).

In the South America region, MERCOSUR countries constructed I-O matrix with 29 products and 29 branches of activities, based on the CSA system and culturality of goods and services, using both monetary and non-monetary indicators. Moreover, cultural activities in these countries are included in mapping and other methodological approaches for the creation of cultural satellite accounts. The objective was to develop a CSA system to achieve supporting decision-making process and evaluation of cultural policies set comparable information system and economic measures at international and cross-country levels, and provide information for structural analysis (p. 25). Including libraries and museums, which are essential resources for creative people. Including primary creative activities. Including replication and distribution of the creative product. For example, television and stereo equipment. Including repair, maintenance, support, second-hand sales. 65

In Australia, the creative trident model has also been used for analyzing the economic contribution of cultural industries, known as the employment-based classification model. This model is used for measuring the scope of the creative economy in Australia (Higgs and Cunningham, 2007).

Volume XXI Issue V Version I

## 18 ( E )

Newton 2007). So, it is difficult to provide an evident for the measuring methodologies in the selected African countries.

In South Africa, direct and indirect economic contribution has been measured for the first time in 2008. The total direct contribution was measured using value added, output, and employment indicators. In the same context, as our best knowledge, conducted researches for measuring the economic contribution of cultural industries in Egypt were scarce. Ghoneim used the questionnaire method and available poor data to measure the importance of cultural industries for Egypt. He estimated the economic contribution of cultural industries by 0.000128% to GNP in 1999 (Gross National Product). Yet, he revealed optimistic estimates that would not exceed 0.5% of GNP. While the indirect contribution was calculated by estimating both output and value-added multipliers (British Council, 2008). Later, other researchers measured the economic contribution of cultural industries in South using four indicators, as follows: the value of production, profitability, employment, and number of firms in cultural industries. Some of these studies also analyzed the structure of culture industries in South Africa using the value chain model (UNESCO, 2012).

## 19 67

. Such estimates were very low, compared with other countries

## 20 VI.

Concluding Remarks (Ghoneim, 2002).

The relationship between culture and economics is debatable and has increasing interests across countries. The research in measuring the economic contribution of cultural industries revealed the importance of cultural industries for stimulating economic growth. Therefore, there is increasing interest to measure the economic contribution of cultural industries, using several approaches and methods.

In light of this study, we may reach several conclusions and suggestions as follow:

First, the importance of cultural industries has been more realized by developed countries. Therefore, the conducted researches of cultural economics are more evident and complicated in developed countries rather than developing countries. The total direct contribution was measured for 11320 firms related to cultural industries in South Africa (British Council, 2008). These estimates were based on four core cultural industries: book publishing industries, music sound recording, film production industry, software industry (Ghoneim, 2002). The economic contribution for the four core industries of culture to GNP by the year 2000 in other countries were as follows: 3.1% in Australia; 2.9 in Germany; 5.06 % in India; 3.6% in UK; and 3.3% in USA (Alikhan, 2001).

Second, cultural industries in developing countries are sometimes considered as a part of the creative industry. At the same time, there is a clear distinction between cultural and creative industries in developed countries, particularly in the EU.

Third, although the realization of cultural industries importance, there are not a clear and common definition for cultural industries in developed and developing countries, this led to difficulties in setting comparable measures for economic contribution of cultural industries at the international level, while comparable measures are much available at local and regional levels.

Fourth, there are several approaches for measuring the economic contribution of cultural industries. Yet, these approaches face serious problems in application, particularly the identification of these industries and activities that should be included in cultural industries, and also there is a lack of a common conceptual framework across countries.

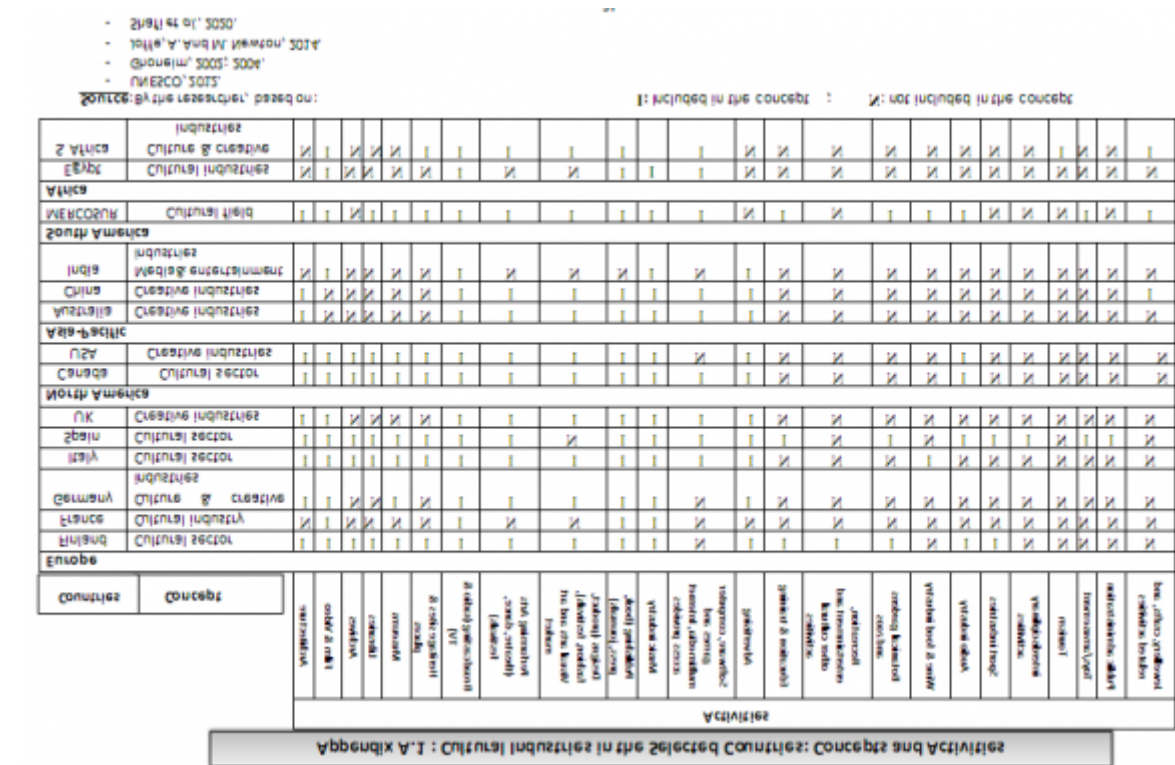

Fifth, data limitation is still the main problem for measuring the economic contribution of cultural industries, due to statistics of cultural industries and statistical methodologies which have not been harmonized in a systematic manner.

Sixth, although difficulties, the measuring approaches of the economic contribution of cultural industries can be effective for analyzing the structure of cultural industries, and their contribution to economic growth. Yet, they are still not enough measures for cultural industries' contribution. So, we can suggest the need for more evolution to new common concepts and measurements of economic contribution for these industries to be more comparable at both regional and international levels.

Seventh, while several approaches of measuring are applied, mapping studies represent a starting point for measuring the economic contribution of cultural economic. So, we can suggest it for measuring the economic contribution of cultural industries for the Egyptian case, which is suffering from scarce researches in this field. Eighth, the Egyptian case needs a clear conceptual framework for cultural industries and also data availability

about these industries. So, constructing cultural satellite accounts (CSA) for Egypt is necessary. That would be a great first step towards measuring the economic contribution of cultural industries in Egypt.
