#### 6 Abstract

In this complex society of today where experiences are innumerable and varied it is not at all 7 possible to present every situation in its original colors hence the opportunities for learning by 8 actual experiences always are not at all possible. It is only through the use of proper audio 9 visual aids that the life situation can be trough in the class room by an enlightened teacher in 10 their simplest form and representing the original to the highest point of similarity which is 11 totally absent in the verbal or lecture method. In the presence of audio aids the attention is 12 attracted interest roused and suitable atmosphere for proper understanding is automatically 13 created, but in the existing traditional method greater efforts are to be made in order to 14 achieve the aforesaid essential requisite. Inspire of the best and sincere efforts on the side of 15 the teacher the net effect as regards under standing or learning in general is quite negligible. 16

17

18 Index terms— audio-visual aids, the secondary school teaching.

# <sup>19</sup> 1 Introduction

he Knowledge pursued by the secondary schools based on nice subtleties of discussions, fine distinctions, plays upon words, quibbles etc. have proud to be a miserable failure for any practical purpose. The sole object was to sharpen the intellect with useless and spurious knowledge. Their metaphysics were cobwebs fine to look at, but unsubstantial and barren of any good results, there by defeating the very purpose of acquiring knowledge-the utility.

25 Guided by this utilitarian aspect of knowledge, unending efforts have been made by the national government to reshape the entire educational system throughout the country by establishing a strong link between the acquisition 26 of knowledge on one hand and the life situations on the other. The efforts of various commission and committees 27 attest the stated fact. The greatest obstacle faced in this connection was to make teaching directly related to life 28 and thus meaningful. It was observed that in today's complex structure of society it is not at all possible to place 29 the learners in the real situations to get direct experience, linking life situations in the trust form. A practical 30 and workable suggestion in the form A / V aids was accepted to be the only solution for providing direct life-like 31 experience in on outside the classroom. This indirect media of communicating real experiences to the learner 32 33 found favor with every one interested in the re-construction of the educational edifice. Today A / V aids are 34 known as widely acknowledged helpful adjuncts to education and find an extensive application throughout the 35 world. Teaching today is made real, lifelike and meaning full by the extensive use of modern A / V aids e.g. 36 films, charts, maps, models and tape-recordings etc.

The entire field of education beginning from the primary stage up to the university level employs the use of A / V aids in teaching.

The extensive application of A / V aids, which employs the direct use of more than one senses at a time leads to a better understanding, formation of clear concepts and permanent learning. Its use and utility in teaching all

the secondary subjects right from language to science, today is well acknowledged in all the educational quarters.

#### 42 **2 II.**

# 43 **3** Audio-Visual Education & its Heritage

In western progressive countries like U.K., U.S.A. and U.S.S.B. the use of A / V aids in teaching is not a fashion
but is a matter belief and actual practice. That to say of ordinary visual aids e.g. charts. Graphs, map, models,
etc. they are using films film-strips, epidiascope, tape-recorder, radio and television to make education valuable
and worthwhile.

In our own country the technique of A / V education is as old as our history and culture. We can also share the 48 pride of using modern scientific methods, of course in disguise, during the period of great ashoka and Chandra 49 Gupta Mourya, or even before when people of west were nothing more than barbarians. Planned education 50 trips were a common feature with the Gurus of ancient india. Guru Kumargiri sent his disciple shwetank to 51 the notoriously popular dancer of her timeschitralekha -to study the difference between virtue and vice thereby 52 employing the medium of direct experience, popularly known today as planned educational trip. The teaching 53 techniques adopted at Nalanda and Takshshila stand at a quite high level. A discussion, dramatization and the 54 use of clay models, was a usual feature, and as a result of it the students after completing their studies faced no 55 difficulty in adjusting themselves in the society. 56

Jatak kathas and panchtantra stories are again glaing examples on vivid narration used by our ancestors, with out-standing advantages. The use of ground floor, bark of trees and the black-board was also in full swing throughout the ages. As such for us audiovisual aids. Are pet entirely novel in origin, but only in the development and to the extern they are used elsewhere.

To find suitable application of A/V aids in secondary school teaching, it becomes essential to review the existing education pattern with its drawbacks and limitations together with the need of change.

# 4 III. Problems Confronting Present

64 Ducationalpattern Particulary at the Secondary Level

Present educational system is condemned very severely by a west majority of the people interested in the remodeling of the education pattern. The following are the major drawbacks receiving a tooth and nail criticism. So far the reading of books, mugging up of classmates and lectures and passing the examination has been considered to be the sole objective of education. Teachers over emphasized the value of books and confined all knowledge within bound pages.

Regarding curriculum the state of affairs had been all the more disappointing. Study of a good many number 70 of subject had the main purpose of leading to scrappy, disintegrated, unassimilated knowledge and that too 71 through dull and life-less teaching making class teaching making class rooms appear as a gathering of inattentive, 72 uninterested, passive learners. All the intellectual traffic used to pass round the student and he stood a with 73 mess to the passing motion and never the less for concepts. This dull teaching has crested less of interest in the 74 students, crushing altogether their originality of thought and action, and serves to be the root cause the increasing 75 problems of indiscipline in the schools. The active portion is completely controlled by the teacher himself leaving 76 only passive listening for the students. This way reality, life-situation, clarity and direct experience etc. are all 77 murdered ruthlessly by the teacher unknowingly. Present teaching largely unknowingly. Present teaching largely 78 employs abstract thinking or superfluous imagination resulting in confused thoughts and notions at times. The 79 description of the hanging gardens of Bombay by a teacher could create only a blurred impression an never and 80 exact conception of the hanging gardens as it requires a mean of initiative drive and imagination to teach such 81 and other matters in relation to the limited experience of the pupils and develop opportunities of education out 82 of concrete situations of every day life. 83

The state of affairs is alarming and hence the necessity of a change has become quite pressing since the dawn of independence. Our wise leaders selected the path of democracy for the nation and gave us a constitution which is matter of pride for all of us. But to be worthy of it may handless are yet to be crossed and the needs of the democratic india are to be satisfied. The major burden lies on the system of education, because that alone can help building a sound democratic structure based on a firm footing.

Citizenship and its proper realization is the back-bone of a democratic structure. It can only be achieved by 89 developing the capacity of clear thinking and a receptivity to new ideas. A scientific attitude of enquiry attitude 90 of enquiry and investigation is to be created, so that the individual may think objectively and base his conclusions 91 on tested data. He must have an open mind always, receptive to new ideas, and must have an open mind always, 92 receptive to new ideas, and must be vigilant about his rights and duties alike. Education must aim at all round 93 development of the individuals personality and in improving his productive efficiency he rely making his useful 94 for himself and the society which he belongs. This all can be done through a sound educational system alone. 95 IV. 96

# <sup>97</sup> 5 Need of a Sound Educational System

The first and foremost consideration in any reconstruction of education in India today should be the training for independent thinking and chalking out the lines of action which ultimately from the very basis of democracy and it can only flourish though the development of clear thinking and the receptivity of new ideas accompanied with

a clarity in speech. Education for the success of democracy must cater to the individual's psychological social 101 emotional and practical needs. The basic ideas of discipline cooperation social sensitive mess and tolerance which 102 ultimately form the essential counter parts of the democratic structure are to be formed by a well integrated 103 system of education. Leadership another great factor responsible for its success once again is the responsibility 104 105 of education. To sum up the burden of making democracy successful in this great country largely depends on the system of education employing teaching techniques suited to create the desired attitudes and habits or in 106 the words of shri K.G. Saiyidain transformation of schools into social communities where healthy normal motive 107 and methods of group work are in operation and children have an opportunity of learning by doing of gaining 108 meaningful social experiences and thereby being trained in the supreme art of living. How to train the pupils in 109 this supreme at of living is a puzzling problem. 110

111 V.

# 112 6 Answer to the Problem

The felt needs of democracy can only be catered by employing modern dynamic methods of teaching. Teaching must be made real effective and linked with life situations and the association of teaching with actual life must linked with life situations and the association of teaching with actual life must bear distinct relationship. All the efforts should be directed to form clear concepts in place of abstract thinking. The classroom should be turned into laboratory for active work while teaching should become bipolar process thereby sharing active with the students as well ensuring interest and motivation which are so essential for a purposeful learning.

Direct experience if provided in the classroom itself, real learning can take place leading to encouraging results. Such social experiences gained this way shall enable the students to develop the art living so badly needed.

# <sup>121</sup> 7 VI. The Golden way to Turn the Dram Into Reality

The shortest route to provide direct experiences clarity of thought interest and activity all at one and the same time, is the extensive use of A/V aids in teaching. "Seeing and hearing looking and learning are major ways by which human being learn. Many media have been developed and are widely used—the A/V aids are powerful testimony of mankind's desire to learn and to learn well."

A/V aids provide opportunity to understand the things in their true form original color and appearance which otherwise is never possible. Their novelty attracts attention objectivity lessens narration and vividness leads to clarity of thoughts. In the complex structure of today's society its not possible to provide opportunity for direct experience all the time and hence A/V aids can ease the situation. It is quite difficult to personally experience the life led by the people of Siberia but the life-like experience can e brought home very easily though a movie film, pictures of eye witness radio accounts which otherwise would have been quite impossible.

The evils of present system of education that is verbalism loss of interest, absence of activity etc. all can be at least minimized of not removed entirely. This belief is raining momentum everyday throughout the country.

VII. Audio-Visual Aids an Fit Well in a) Traditional system (from primary stage to higher secondary) b) Basic
 system of education c) Project method kindergarten Montessori etc.

Traditional system of education employing lecture method of teaching is being criticized in every quarter by 136 every one in the field of education today. It has become the fashion of the day to condemn the entire educational 137 system without pausing to think that such sweeping condemnation duos more harm than good. No doubt the 138 lecture method has proved to be of no avail and the substitution of the dynamic methods of teaching in its place 139 is he slogan of the day. Yet the anticipate change needs some time and what is to be done till then is head aching 140 problem. The solution lies in the introduction of suitable A/V aids. Narration can be made more meaningful 141 and rich and purposive by their use. The life less teaching can easily become full of life by merely using proper 142 teaching aids at proper occasions. The same out of date lecture method can prove to be effective and useful till 143 it is completely replaced by entirely new techniques of teaching by using A/V aids. Whatever the method of 144 teaching might be the utility of proper teaching aids at proper stage can never diminish. Perceptual experiences 145 leading to a clear understanding "ill always lend the teaching techniques and that is possible with proper teaching 146 aids. 147

Basic system of education which has been adopted the government of india to be the national pattern of education and the fast changing number of traditional schools into basic leaves no merging for nay doubt. The direct method of teaching has been attached much importance to under basic system. The method of teaching and approach to the subject differs widely from those of common and popular educational system. Under the basic system no subject is taught as an exclusive and separate unit but it is taught by making the centre such developed activity as might be correlated to other subject. The teachers therefore make a plan of all those closely correlated subjects and thus an indissoluble link established among the life knowledge and activity.

A/V aids if used properly and in an organized way will decidedly make the correlation real and effective and the link thus established between life knowledge and activity will be quite natural and understandable. It is only due to thin reason that the use of A/V aids is paining ground rapidly in the basic system of education. The field of activity is best covered by preparing teacher-student make aids. Both ends arte served simultaneously the teaching aids are prepared as well as the activity purpose is also fulfilled.

#### 8 VIII. PERSONS FOR SELECTING NATURAL SCIENCES MATHEMATICS AND SOCIAL STUDEIS AS SPECIAL SUBJECTS FOR STUDY

The greatest advantage of A/V aids lies in the fact the they can be used with equal efficiency and utility right 160 from the primary stage upto university level even with slight changes of course in the selection of the learners but 161 their value remains unchanged throughout. At primary level the aids work marvelously well due to the limited 162 experience of the children and they develop and enrich them in an interesting manner. At the secondary level 163 their utility has been already discussed. Their planned use provides them rare experience in the natural form 164 which otherwise would not have been possible. At the university stage also the use of A/V aids like films film 165 strips tape recorder epidiascope etc. has found treat favor and ae used to bring home the experiences of distant 166 people in the sphere of science and arts. Difficult ideas are presented through A/V aids in most simple interesting 167 manner. This is not all A/V aids due to their inherent novelty, utility and interest capturing capacity find a very 168 wide use in modern methods of teaching like project Montessori and kindergarten etc. their extensive use in most 169 interesting and well planned manner have made them realistic perfectly psychological and most effective. The 170 wide use of warios apparatus instruments coloured blocks patterns and illustrative pictures etc. in the Montessori 171 and kindergarten systems of education confirm the great use fullness of A/V aids and leave no trace for 172 any doubt. 173

# <sup>174</sup> 8 VIII. Persons for Selecting Natural Sciences Mathematics and <sup>175</sup> Social Studeis as Special Subjects for Study

At the secondary stage the study of natural sciences is receiving and increasing emphasis day by day. The 176 177 browning number of the students offering science group at high of higher secondary stage, and inclusion of 178 general science as a compulsory subject of study justifies its great significance. Perhaps it is due to the impact of technological development taking place in the country and an ever increasing demand of skilled workers for 179 feeding the various industries running or in making all over the country. Obviously such an important subject 180 like science must receive the immediate attention of those entrusted with responsibility of teaching the subject at 181 different levels. In the name of this responsibility an effort is made through this study to trace the possibilities 182 of using A/V aids in teaching science at the secondary level to make the teaching real purposive and useful. The 183 importance of natural science have also been realized by the medallion commission in the following words: "An 184 understanding and appreciation of the fundamental principles of the natural and physical science is essential to 185 186 effective living in the world of today."

The well planned use of A/V aids can provide a clear understanding through creatural experiences leading to effective living so much stressed by the secondary education commission. Therefore to explore the possibilities of enriching teaching techniques in the field of natural sciences through A/V aids is a felt need and deserves top priority.

The study of mathematics forms the very foundation of learning due to its extensive application in actual life. 191 It serves as a feeder and an unavoidable asset for the study of all natural and social sciences. Its firect relation 192 with has provide it a firm footing in the form of a compulsory subject of study at the secondary level. Its utility 193 in real life situations is so great and well acknowledged that it needs no further explanation. Such acknowledged 194 and important subject has been made a head aching problem for a considerable majority of students. The 195 responsibility for making is dry as dust lied on the teachers and their out dated teaching methods. The greatest 196 197 handicap is caused by the extensive application of abstract thinking and its dissociation with situations is to be very clearly emphasized to make mathematics teaching interesting real and worthwhile. The use of A/V aids 198 can certainly remove handles. Its complexity abstract thinking and toughness can be much minimized by the 199 introduction of suitable aids. That these aids can be and to what extent they can be used is problem which needs 200 a careful study and a deeper insight. 201

Coming to social studies its importance in today's life is a well know fact. To preserve our infant democracy to make the future pillars of the nation strong and worthy of the great heritage it is extremely essential to build not only a sense of national patriotism, but a keen and lively sense of one world and love for humanity at large.

These ideas are to be fused in the actual behavior of the students and this can only happen when the study of social studies is made to be the study of every day life routine. Rich meaningful and vast experiences alone can set the ball rolling. Civics efficiency the soul of democracy can only be housed in the hearts of every individual by enriching his experiences thereby providing him a direct opportunity to learn. This all is never possible through narration technique alone and hence the change is a pressing need.

A/V aids if properly planned well organized and carefully used can work well with highest possible efficiency in enriching the experiences of the learners to a considerable extend. Experiences of foreign lands and people can easily be associated with our own and used with advantage.

How this great advantage of bringing valuable experiences into the class room itself is to be availed in the light of our present resources needs a thought investigation of the available A/V aids their utility and adaptability in making teaching effective.

#### <sup>216</sup> 9 IX.

#### <sup>217</sup> 10 Nature of Audio-Visual Instructions

In the words of audio visual instructions simply mean the presentation of knowledge to be gained through the seeing experience whereas according to Roberta visual education is a method of imparting information which is based upon the psychological principle that the one has a better conception of the thing he sees than of the thing he reads about or hears or discusses.

Audio aids include never devices sound films radio programes tape recorder, phonograph records etc. but every word spoken by the teacher in an educational setting falls in the preview of audio instruction.

#### <sup>224</sup> 11 X.

# <sup>225</sup> 12 What Audio Visual Instruction

226 Meand?

227 Audio visual instruction simply means a supplementary device for waking learning objective real and effective. 228 Experiences provide with the help of audio visual aids are generally interesting full of life and provide a clear 229 vision leading to perfect understand ability and adaptability in life. Audio visual aids are not self contained 230 teaching devices. They are not in the field of learning to replace anything books teachers of audio visual aids can be found only when the separate entity is completely of audio visual aids can be found only then their separate 231 is completely merged and they join hands with the existing techniques. They are good only because thy make 232 the learning. They are important because they make experiences important by attaching importance to their 233 nature existence and further use. They contribute towards clear consenting better understanding and permanent 234 learning. 235

Te general criticism launched against the use of audio visual aids is that they provide entertainment at the cost of discipline. It may be true in the case of motion pictures dramatic and trines all of cheap quality unplanned and aimless the effect of them will certainly be disappointing the cause of disappointment is not he aid itself but the lack of proper planning use and the aim.

Audio visual aids are not designed to amuse the learner but to create and increase the interest to provide a learning atmosphere by using the two treat senses of sight and hearing more difficult and distasteful work is the more education is now an outdated along an and can no longer be preserved behind the iron curtain of discipline.

# <sup>243</sup> 13 XI. Audio Visual Instructions & their Heritage

Audio visual aids audio visual techniques audio visual education, audio visual instructions etc. There names are 244 certainly of recent origin and appear quite new in form. But in fact they are as old as the primitive man in reality. 245 Our ancestor used gestures signs. Symbols, facial expressions stone pieces piece of ground tree leaves and thrones 246 for conveying their thought which was in reality nothing else but the blending of audio & visual techniques in 247 the crude form. Ancient india presents a number of examples where stones were used by the Aryans in conveying 248 some message or indicating the anticipated danger. This covered the visual part and the other audio one was in 249 the form of verbal expressions. Later on during Ashoka's reign pillars with inscribed moral teaching are living 250 monuments of visual instructions and the roaring announcements made at the beating of drums provide it the 251 audio touch of today. Things were present but not in the present form. With the advancement of knowledge 252 the aids developed. From ground slate to the bark of the trees and then came black board the eldest aid know 253 and extensively used in the field of learning even today. Traits were taught through observation and imitation. 254 Later came pictures puppets sculptures stained glass representations and paintings etc. real object were used to 255 an extent of availability. Planned trips were also in vogue long-long back in Greek schools. Erasmus, Benjamin 256 Franklin & many other great tinkers' leaders and educationists recommended planned education trips along with 257 other aids. In our country also goring examples of the use of planned educational trips are available during 258 maurya perked 325 B.C. where Gurus adopted the technique of planned trips in order to explain difficult of the 259 magic lantern opened a new chapter in the history of audio-visual aids in 1946 which can righty claim to be the 260 predecessor of several types of modern audio visual apparatus with the advancement of scientific knowledge aids 261 developed multiplied and gained and unquestionable status in the field of learning. 262

#### <sup>263</sup> 14 XII. Why we Should use Audio Visual

264 Material in the Field of Learning at All?

Doing of distasteful tasks mechanically in the name of discipline and hard work had been a recognized principle in the field of education in our country. So much so that the help of the rod was always sought for the proper development of the child. The saying spare the rod and spoil the child dominated learning for the past many years. The question of liking and interest seems to have never arisen at all. The parents and teachers all together poured all the desirable knowledge in the disguise of best judges with out caring the least for liking. Liking and interest remain their sole monopoly and their decision regarding the nature of work was all final whether liked or disliked by the child was immaterial. The fading traces of this tendency exist even today in minor forms. With the advancement of knowledge labour of great thinkers and psychological investigation the place of inters has now been recognized fully in the field of learning. With the efforts of Johan Dewey and his interpreter's education entered a new era the slogan of which I.E. discover and capitalize child interests. This great idea found fullest expression in the changing system of education in our country and revolutionized the entire educational organization materials and techniques.

Basic system the accepted pattern of education embraces the factor of liking and interest in its most true sense. Inclusion of a wide range of local crafts which form the core of all knowledge in the degree of intensity of interests.

#### 280 **15 XIII.**

#### <sup>281</sup> 16 Newerconcept of Motivation

Motivation literally means to move and is considered to be of two kinds extrinsic and intrinsic.

Formerly motivation was largely extrinsic both negative and positive. In the negative form the child was force to do a certain number of thing through punishment of fear without caring for his distaste and lack of interest.

The result was the creation of the getting by attitude in the students. Learning the forced proud of no avail and the results were barren.

In the positive type of extrinsic motivation the child was encouraged to do school work with the temptation of prizes privileges marks and honors. This led to the division of attention between the task and the awards and threw the task in the background. Motivation certainly exists but is always directed towards the award and the importance of the problem or the task is reduced too much.

Hartshorne states in this connection. "there is increasing dissatisfactions with the toward system and less and less dependence upon it for motivation of activities—beads and coups and merit badge dear as they are to the heart of a child are hardly a substantial foundation for motivation of life's purposes and when a leader deliberately cultivated dependence upon such external award even though they have o intrinsic value he helps to

establish those self sleeping motives which grow at the vitals of our social order.

# <sup>296</sup> 17 XIV.

#### <sup>297</sup> 18 Intrinsic Motivation

Psychology of learning brought the doctrine of interest into lime light and established that the child has got vital 298 inherent interests and the education must discover and develop and use them for beneficial ends. To meet this 299 end modern education provides happy cheerful and pleasant atmosphere in the school in a dignified way and on 300 a high plane. School buildings curricular and extra curricular activities are planned today to keep the interest 301 of pupils not only alive but accelerated and to suit the varying interests of the children. Methods materials and 302 303 techniques are useful and natural rather than academic and artificial. The belief today is that a worthy motive 304 is an inducer and incite or an impeller and is always based on interest. Curiosity is the mother of all knowledge and serves as great stimulus to an immense amount of what otherwise be drudgery. 305

Audio visual aids provide intrinsic motivation to a great extent. Their novelty simplicity and objectivity attract the pupils too much and their curiosity to know more and more is thousand times magnified. They derive pleasure in understanding them and their importance. This sharp diverse from the traditional verbal instructions provide a lot of freedom to the pupils and makes learning interesting.

# 310 **19 XV.**

What Radio can d o? In western countries today radio become an essential part of the educational system. It's frequent but well planned use is gaining momentum every moment with the river increasing favor of the educations.

"In U.S.A. radio has created a nation of listeners. Twenty states have organized state wide educational broad casting activities and learning experiences in conversation are music creative dramatics and citizenship reach listeners in almost 4,000 community and rural schools. More that 450,000 children listen and learn them create and study in response to radio listening activities."

318 In United Kingdom 98% of the schools are equipped with radio and their regular daily programmers for all of 319 them. There is separate organizing body known as school broadcasting council for the U.K. formed by the B.B.C. 320 in 1947. The council guided B.B.C. in the previsions of broadcast programmed for schools in the U.K. the council is assisted by five sub committees responsible for education broadcast programmed for different age groups. BBC 321 has got a separate department under the name the school broadcasting department which is responsible for 322 translation the wishes of the council into broadcasting. Out of these magnetic black board serigraphy bulletin 323 board and the Tack board need a brief introduction as their use is not very common today. Other visual aids 324 are already in the field and hence their description will certainly be out of place. 325

#### 326 **20** XVI.

# 327 21 Out Standing Visual Aids

#### <sup>328</sup> 22 a) Magnetic Black Board

The most elastic and practical varieties of mobiles pictures are the flannel graph and the magnetic black board. The principle in both the cases in that moveable objects are made to adhere temporarily to a background.

Magnetic black board is a board made of thin steel sheet painted black and the illustrative material is fixed to a small half Danny shape magnets which stick to the back ground and the purpose of the illustration is best served. This type of black board makes the points more clear and illustrates exactly the point no more and no

334 less.

# 335 23 b) Serigraphy

Known as mitography of silk screen printing display posters can easily be produced with an expenditure of few annals only. Its earliest prototype is the Japanese method of stencil making. Only a well organized stencil is require which can easily be prepared with the help of an art teacher and can be used with great advantage in preparing charts posters maps and graphs. By this techniques even a teacher not knowing art also prepare aids and help improving his teaching technique himself.

# 341 **24 XVII.**

#### 342 25 Dramatisation

Adopting this medium difficult knowledge can be imported in a most welcome manner and quite easy form. It finds particular use in the teaching of social studies. Dramas based on historical events, social and civic problems etc. can be staged with advantage.

Besides the problem considered it pays much in improving the speech action and the attitude of the students. Indirectly they learn many more things in one single activity. Organization, discipline and control are automatically taught. Dramatization finds an extensive use in teaching the languages.

# 349 **26 XVIII.**

#### 350 27 Puppetry

In our country its nothing novel -KATH-PUTLI-KA-KHEL-which was once very common in India is still in vogue in many states like Rajasthan. But mostly it is used for more entertainment. If can serve education ends to its best stories and plays can very well be depicted with this medium in most interesting way and in easily understandable form. Our old Kath-Putli payers put historical events in the most realistic form and interesting manner even today, which is perfectly educational. If these talents is harnessed and used in the field of education much can be achieved particularly in the rural schools.

# <sup>357</sup> 28 XIX. experimental design

Verbalism is the bane of education audio visual aids are an antidote to this hoary malady verbalism. Every one today says it believes it yet it needs scientific basis in the form of experimental results to consolidate Facts. Under the existing circumstances. This broad day light truth of the great utility of audio visual aids in the field of education is also criticized by many educational thinkers behind the shield of local circumstances situations and the resources of the country. As such a scientific footing through actual experiment has been conducted in order to compare the two methods of teaching i.e. traditional or lecture method and the teaching through audio visual aids in the sphere of social studies.

For this purposes shrikanwartara public higher secondary school mandleshwar. Was selected with two sections a and b of class vii consisting of twenty and seventeen students respectively.

As regards psychological factors like age intelligence quotient (I.A.) social status the opinion of the class teacher and the headmaster was sought together with the marked obtained by the students at their last annual examination i.e. of class VII in social studies.

All the information thus gathered proved that poth the sections contained a homogeneous well balanced mixed group of students and corroborated the fact laid by the headmaster that the sections were divided on the basis of admissions only and not according to the intelligence. The marks obtained by the students in social studies at the last annual examination are as follows:

The tack board (bulletin board, wall display or study display) is a device for displaying to the learner's graphic photographic or other study materials. The above scores clearly show that in both the sections intelligent average and dull students have evenly been distributes and as such both the sections stand at a common level and represent a perfectly homogenous group.

A lesson on the topic mandu fort selected from the Madhya Pradesh education department social studies syllabus for VI, VII and the VII classes under the head-historical information of M.P. was planned covering all the detailed information regarding the builder the buildings religious background historical importance etc. the
 lesson was taught in the section A with the help of the following audio visual aids on January 2011.

Aids used in class VII "A" (taught through A/V aids): With colourd chalks.

383 In the beginning only the historical background locatin, importance, impact of religions and the beauty of art and sculpture regarding mandu fort was introduced in the class in not shell. Then the students were made 384 familiar with the film its contents and the right learning attitude ripe with anxiousness was developed by the 385 teacher through timely instructions for viewing the film. Soon after the film show was arranged and the students 386 delightfully enjo9yed it. With the selected references from the film the direct association was established and 387 the other aids I.E. charts, maps, models etc. helped to visualize the past experience and also provided sufficient 388 incentive to the students to continue interest. Well disciplined class, display interested students and the activity 389 atmosphere was an outstanding feature deserving recognition. 390

The same lesson was taught with the same preparation and equal efficiency in the other section section I.E. section 'B' but without using any other aid except black board.

#### <sup>394</sup> 29 Construction of the Achievement Test

An achievement test was devise on modern educational lines on the lesson taught. This test was prepared keeping into consideration the standard of the class the prevalent system of examination and their close association with the students and the balance with the new type of tests was kept by including fifty percent questions on the old essay type questions. The total score of thirty marks was equally divided between the two types. This dual system was adopted only to provide a favorable situation for the students and to minimize their difficulties while facing altogether novel circumstances. The test thus aimed at finding out the level of understanding in a homely atmosphere mixed with novelties. A copy of the test is given in appendix No. C XXI.

# 402 **30** Administering the Test

403 The test contained nine questions in all out of which only three were of traditional type. Half an hour's time was 404 given for completion.

Before the actual conduction of the test necessary instructions regarding the nature of the questions and the way to give answers were given to the students in both the section separately. The test was conducted and the marks scored by the students of both the sections are as follows.

The results thus obtained have been graphically represented on the touching page. RED CURVE represents scores of the section 'A' while Blue curve is for the section 'B'.

The lowest limit for the section 'A' is 15 which happens to be the highest limit for section 'B' in section 'B' the lowest limit as indicated is only 1 and the scores range between 1 and 15 while in section 'A' the range clearly lies between 15 and 22. The bar graph representation clearly brings out the difference of scores (figure no.5)

The most interesting point in the test was about first question which was for ten marks and included ten pointed questions with a definite reply as shown in appendix C. this question was attempted by every student of both the section and the individual scores run as shown under.

416 Roll No.

#### 417 31 Maximum marks 30

#### 418 **32** Marks obtained

419 Section 'A' Section 'B' This question shows that out of twenty students of section 'A' seven scored cent per cent 420 marks and the lowest score was eight while in section 'B' the range is between zero and nine only and the majority 421 of the students are found at three.

#### 422 **33 XXII.**

#### 423 **34** Teachers Reactions to the Experiment

The comparison of the scores of both the sections as shown in the graphic illustration goes to establish very clearly that the level of understanding was better in the first section I.E. section 'A' where audio visual aids were utilized to their best. More marks obtained by a large number of thee student go to prove understanding within the reach of every individual. The great amount of interest raised enthusiasm eagerness and curiosity to learn minimizing the diversion of attention and eliminating te problems of discipline altogether.

Audio visual aids stimulate interest motivate prepare students for real understanding thus facilitating learning in the true sense. They serve well for all the students' good average and poor and help them to progress steadily. Thought audio visual aids the experiences which otherwise are completely denied can be easily brought in the

432 class room itself and a realistic touch can be given to the subject matter very easily. XXIII.

# 433 **35** Conclusion

In this complex society of today where experiences are innumerable and varied it is not at all possible to present 434 every situation in its original colors hence the opportunities for learning by actual experiences always are not at 435 all possible. It is only through the use of proper audio visual aids that the life situation can be trough in the 436 class room by an enlightened teacher in their simplest form and representing the original to the highest point of 437 similarity which is totally absent in the verbal or lecture method. In the presence of audio aids the attention is 438 attracted interest roused and suitable atmosphere for proper understanding is automatically created, but in the 439 existing traditional method greater efforts are to be made in order to achieve the aforesaid essential requisite. 440 Inspire of the best and sincere efforts on the side of the teacher the net effect as regards under standing or learning 441 in general is quite negligible. 442

The efforts generally go in vain causing many disciplinary problems and loss of understanding as depicted in the cartoon illustration on page no. ??Figure No.6).

This way a major amount of the teacher's energy is being wasted every minute at eye altar of student's interest and curiosity which if properly utilized by the use of suitable audio visual aids marvels can be done with promising results. This experiment has proved the validity of using audio visual aids to a considerable and hence nothing concrete can be said with cent per cent confidence but it is expected that if more experiment are performed the results might agree in considerable proportion with the results obtained in the cities experiment. <sup>1</sup>
